

USER GUIDE

Enterprise Wi-Fi Access Point

Release 6.6.0.1

Reservation of Rights

Cambium reserves the right to make changes to any products described herein to improve reliability, function, or design, and reserves the right to revise this document and to make changes from time to time in content hereof with no obligation to notify any person of revisions or changes. Cambium recommends reviewing the Cambium Networks website for the latest changes and updates to products. Cambium does not assume any liability arising out of the application or use of any product, software, or circuit described herein; neither does it convey license under its patent rights or the rights of others. It is possible that this publication may contain references to, or information about Cambium products (machines and programs), programming, or services that are not announced in your country. Such references or information must not be construed to mean that Cambium intends to announce such Cambium products, programming, or services in your country.

Copyrights

This document, Cambium products, and 3rd Party software products described in this document may include or describe copyrighted Cambium and other 3rd Party supplied computer programs stored in semiconductor memories or other media. Laws in the United States and other countries preserve for Cambium, its licensors, and other 3rd Party supplied software certain exclusive rights for copyrighted material, including the exclusive right to copy, reproduce in any form, distribute and make derivative works of the copyrighted material. Accordingly, any copyrighted material of Cambium, its licensors, or the 3rd Party software supplied material contained in the Cambium products described in this document may not be copied, reproduced, reverse engineered, distributed, merged or modified in any manner without the express written permission of Cambium. Furthermore, the purchase of Cambium products shall not be deemed to grant either directly or by implication, estoppel, or otherwise, any license under the copyrights, patents or patent applications of Cambium or other 3rd Party supplied software, except for the normal non-exclusive, royalty free license to use that arises by operation of law in the sale of a product.

Restrictions

Software and documentation are copyrighted materials. Making unauthorized copies is prohibited by law. No part of the software or documentation may be reproduced, transmitted, transcribed, stored in a retrieval system, or translated into any language or computer language, in any form or by any means, without prior written permission of Cambium.

License Agreements

The software described in this document is the property of Cambium and its licensors. It is furnished by express license agreement only and may be used only in accordance with the terms of such an agreement.

High Risk Materials

Cambium and its supplier(s) specifically disclaim any express or implied warranty of fitness for any high-risk activities or uses of its products including, but not limited to, the operation of nuclear facilities, aircraft navigation or aircraft communication systems, air traffic control, life support, or weapons systems (“High Risk Use”).

This product is not restricted in the EU. Any High Risk is unauthorized, is made at your own risk and you shall be responsible for any and all losses, damage or claims arising out of any High-Risk Use.

About This User Guide	10
Overview of Enterprise Wi-Fi AP products	10
Intended audience	10
Purpose	10
Related documents	10
Existing hardware platforms	11
Premium feature list	11
Chapter 1: Quick Start – Device Access	13
Powering up the device	13
PoE switches (802.3af/802.3at/802.3bt)	13
PoE adapter	14
DC power supply	15
Accessing the device	15
Device access using default or fallback IP	16
Device access using zeroconf IP	17
Device access using DHCP IP address	18
LED status	18
Chapter 2: Onboarding the Device	20
Overview	20
Device onboarding and provisioning	20
cnMaestro	20
XMS-Cloud	21
Swift	21
Chapter 3: Using the UI	23
Logging into the UI	23
Viewing the home page (dashboard)	24
Monitor	26

Configure	27
Operations	27
Troubleshoot	27
Chapter 4: Configuring the System	28
Basic	28
Power over Ethernet (PoE) in	31
Power over Ethernet (PoE) Out port	33
Link Layer Discovery Protocol (LLDP)	34
Management	35
Administrator Access	35
HTTPS Proxy server configuration	38
Time settings	38
Event logging	39
SNMP	40
Chapter 5: Configuring the Radio	42
Overview	42
Configuring Radio parameters	42
Basic	42
Software Define Radio (SDR) capabilities	49
Enhanced Roaming	51
BSS Coloring	52
Target Wake Time (TWT)	52
Receive sensitivity configuration	52
Multicast-snooping and Multicast-to-Unicast conversion	52
Chapter 6: Configuring the Wireless LAN	54
Overview	54
Configuring the WLAN parameters	54
Basic	54
WLAN VLAN allowed list	67
ICMPv6 Router advertisement (RA) unicast conversion	68

802.11k/v	68
Radius server	68
Guest Access	72
Usage Limits	88
Scheduled Access	88
Access	90
Passpoint	93
Radius attributes	95
Enterprise PSK (ePSK)	96
ePSK expiry	97
Creating a Personal Wi-Fi ePSK	98
RADIUS based ePSK Premium feature	98
Groupwise Transient Key (GTK) per VLAN	100
Chapter 7: Configuring the Network	101
Overview	101
Configuring Network parameters	101
IPv4 network parameters	101
Routes	106
IPv6 network parameters	109
General network parameters	113
Ethernet Ports	113
General network parameters	117
Security	118
DHCP	119
Tunnel	121
Point-to-Point Protocol over Ethernet (PPPoE)	125
VLAN Pool	126
Wireless Wide Area Network (WWAN)	128
Chapter 8: Managing Filters	130
Overview	130

Filter list	130
Filters	130
Configuring filter CLI	130
Device class filter	134
Wi-Fi Calling support	135
Air cleaner	135
Application control Premium feature	137
Deep Packet Inspection (DPI)	137
Chapter 9: Wireless Intrusion Detection Systems (WIDS)Premium feature	150
Wireless flood detection	150
Neighbour/Rogue AP detection	150
Ad Hoc network detection	150
Chapter 10: Configuring Services	152
Overview	152
Configuring services	152
User Groups Premium feature	152
Location API	154
Speed Test	155
DHCP Option-82	156
BT location API	158
Bonjour Gateway	160
Link Aggregation Control Protocol (LACP)	161
Real Time Location System (RTLS)	162
Chapter 11: Operations	163
Overview	163
Firmware upgrade	163
System	164
LED Test flashing pattern	165
Configuration	165
Chapter 12: Troubleshoot	167

Overview	167
Logging	167
Events	167
Debug Logs	168
Radio Frequency (RF)	168
Wi-Fi Analyzer	168
Packet capture	170
Performance	171
Speedtest on Access Point	171
Connectivity	171
XIRCON tool support	175
XIRCON tool support for Linux 1.0.0.40	175
Chapter 13: Management Access	176
Local authentication	176
Device configuration	176
SSH Key authentication	176
Device configuration	177
SSH Key generation	177
RADIUS authentication	179
Device configuration	180
Chapter 14: Mesh	181
Deployment scenarios	181
Mesh configurable parameters	183
Order of Mesh profile configuration	185
Mesh Auto Detect Backhaul	191
Scenario 1	191
Scenario 2	192
Scenario 3	193
Mesh Muti-Hop	196
Mesh Roaming	197

Mesh Base configuration	197
Mesh Client configuration	198
Mesh link-Sample configuration	199
VLAN 1 as the management interface	199
Non-VLAN 1 as the management interface	203
Typical use-cases	207
Additional mesh topology supported	208
Chapter 15: Guest Access Portal - Internal	209
Introduction	209
Configurable parameters	210
Access policy	211
Splash page	212
Redirect parameters	212
Success message	213
Timeout	213
Whitelist	214
Configuration examples	214
Access Policy - Clickthrough	215
Chapter 16: Guest Access Portal - External	217
Introduction	217
Configurable parameters	217
Access policy	219
WISPr	219
External portal post through cnMaestro	219
External portal type	219
Redirect parameters	219
Success message	220
Timeout	220
Whitelist	221
Configuration examples	221

Access Policy – Clickthrough	222
Chapter 17: Guest Access – cnMaestro	224
Chapter 18: Auto VLAN	225
Chapter 19: Device Recovery Methods	226
Factory reset via ‘RESET’ button	226
Boot partition change via power cycle	226
Disable factory Reset Button	227
Chapter 20: Command-Line Interface (CLI)	228
Show commands	228
Service commands	231
Service show	231
Service system	232
Chapter 21: cnMaestro X Assurance	234
Glossary	235
Appendix	237
Supported RADIUS Attributes	238
WISPr VSAs (Vendor ID: 14122)	238
Cambium VSAs (Vendor ID: 17713)	239
Standard RADIUS attributes	242
RADIUS attributes in authentication and accounting packets with WPA2-Enterprise security	244
Supported CoA messages	246
Supported DFS channels	248
Supported 6 GHz countries	249
Cambium Networks	251

About This User Guide

This section describes the following topics:

- [Overview of Enterprise Wi-Fi AP products](#)
- [Intended audience](#)
- [Purpose](#)
- [Related documents](#)
- [Hardware platforms](#)
- [Premium Feature List](#)

Overview of Enterprise Wi-Fi AP products

This User Guide describes the features supported by Enterprise Wi-Fi Access Point (AP), and provides detailed instructions for setting up and configuring Enterprise Wi-Fi AP.

Intended audience

This guide is intended for use by the system designer, system installer, and system administrator.

Purpose

Cambium Network's Enterprise Wi-Fi AP documents are intended to instruct and assist personnel in the operation, installation, and maintenance of Cambium's equipment and ancillary devices. It is recommended that all personnel engaged in such activities be properly trained.

Cambium disclaims all liability whatsoever, implied or expressed, for any risk of damage, loss, or reduction in system performance arising directly or indirectly out of the failure of the customer, or anyone acting on the customer's behalf, to abide by the instructions, system parameters, or recommendations made in this document.

Related documents

Table 1 provides details of related documents for Enterprise Wi-Fi AP.

Existing hardware platforms

Table 2 lists the existing hardware platforms in Enterprise Wi-Fi Access Points:

Warning

Release 6.x is no longer supported on Wi-Fi 5 APs. It was provided for the Wi-Fi 5 APs as a BETA release only. Any issues on these APs running release 6.x will not be supported by the Cambium Support team.

Table 2: Existing hardware platforms

Hardware Platform	Description
XE3-4	4x4:4; 2x2:2; 2x2:2 802.11a/b/g/n/ac wave 2/ax Tri-Radio Indoor Wi-Fi 6e Access Point with BLE IoT radio
XE3-4TN	4x4:4; 2x2:2; 2x2:2 802.11b/g/n/ac wave 2/ax Tri-Radio Outdoor Wi-Fi 6e Access point with BLE IoT radio
XE5-8	8x8:8; 4x4:4; 4x4:4; 4x4:4 802.11a/b/g/n/ac wave 2/ax Tri-Band AP with multi-radio SDR with BLE IoT radio
XV2-2	2x2:2; 2x2:2 802.11a/b/g/n/ac wave 2/ax Dual-Radio Indoor Access Point
XV2-2T0	2x2:2; 2x2:2 802.11a/b/g/n/ac wave 2/ax Dual-Radio Outdoor Access Point, Omni antenna, PoE out with BLE IoT radio
XV2-2T1	2x2:2; 2x2:2 802.11a/b/g/n/ac wave 2/ax Dual-Radio Outdoor Access Point, Sector antenna, PoE out with BLE IoT radio
XV2-21X	2x2:2; 2x2:2 802.11a/b/g/n/ac wave 2/ax Dual-Radio Indoor Wi-Fi 6 Access Point
XV2-22H	2x2:2; 2x2:2 802.11a/b/g/n/ac wave 2/ax Dual-Radio Indoor Wi-Fi 6 Wall-Plate Access Point with BLE/Zigbee IoT radio
XV2-23T	2x2:2; 2x2:2 802.11a/b/g/n/ac wave 2/ax Dual-Radio Outdoor Wi-Fi 6 Access Point
XV3-8	8x8:8; 4x4:4 802.11a/b/g/n/ac wave 2/ax Tri-Radio Indoor Access Point with BLE IoT radio

Premium feature list

Release 6.0 and later releases of Enterprise Wi-Fi AP firmware support certain advanced features that are available only through a paid subscription to cnMaestro X or XMS-Cloud management. These features are identified with the label **Premium feature** in the documentation. With Release 6.5 and later releases, end users can access these features without a management subscription on a free trial basis and for a limited

time. As Cambium Networks releases new versions, restrictions will be enforced on the use of these premium features only in conjunction with a current cnMaestro X or XMS-Cloud subscription. If the user does not have a current subscription at that time, the APs will stop enabling configurations, including these premium features.

Table 3: Premium feature list

Feature Name	Release Details
Wireless Intrusion Detection Systems (WIDS)	Release 6.4.2
RADIUS-based ePSK	Release 6.4
ePSK scale (more than 300 keys)	Release 6.3
Stanley AeroScout Location Engine	Release 6.3
User Groups	Release 6.2
Advanced Filters (QoS, DSCP, Schedule, and Rate limit)	Release 6.0
Application Control	Release 6.0

Chapter 1: Quick Start – Device Access

This chapter describes the following topics:

- [Powering up the device](#)
- [Accessing the device](#)
- [LED status](#)

Powering up the device

This section includes the following topics:

- [PoE switches \(802.3af/802.3at/802.3bt\)](#)
- [PoE adapter](#)
- [DC power supply](#)

Enterprise Wi-Fi AP product family can be powered using an Ethernet PoE Switch or a PoE midspan injector. Note that some APs can be powered by 802.3af, while others may require 802.3at or 802.3bt. Additionally, some APs can be powered with an external power supply. Refer to the related product datasheet to determine the options available.

PoE switches (802.3af/802.3at/802.3bt)

Enterprise Wi-Fi APs negotiate the power via the LLDP mechanism. [Figure 1](#) represents the Enterprise Wi-Fi AP Eth1 port connecting to a switch (PoE PSE Port).

Figure 1: Installation of Enterprise Wi-Fi AP to PSE port

[Table 4](#) provides detailed information on the AP modules that are enabled based on power negotiated via LLDP.

Table 4: Power management policy

Platform	IEEE 802.3af (12.95W @ PD)	IEEE 802.3at (25.5W @ PD)	IEEE 802.3bt Class - 0/1/2/3/4 (40W @ PD)	IEEE 802.3b Class - 5/6 (51W @ PD)	IEEE 802.3b Class - 7/8 (64W @ PD)
XV3-8	✓	✓	✓		
XV2-2	✓	✓			
XV2-2T0	✓	✓	✓	✓	
XV2-2T1	✓	✓	✓	✓	
XE5-8		✓	✓	✓	✓
XE3-4	✓	✓	✓		
XV2-21X	✓	✓			
XV2-23T	✓	✓			
XV2-22H	✓	✓			
XE3-4TN	✓	✓	✓	✓	✓

PoE adapter

To power up the device using a PoE adapter, perform the following steps:

1. Connect the Ethernet cable from the Eth1/PoE-IN port of the device to the 5 Gigabit Data + Power port of the PoE adapter.
2. Connect an Ethernet cable from your LAN or computer to the 5 Gigabit Data port of the PoE adapter.

Figure 2: Installation of Enterprise Wi-Fi AP to a PoE adapter

3. Connect the power cord to the adapter, and then plug the power cord into a power outlet as shown in [Figure 3](#). Once powered ON, the Power LED should illuminate continuously on the PoE adapter.

Figure 3: Connecting PoE adapter to a power outlet

DC power supply

The Enterprise Wi-Fi AP XV3-8 has an option to power via a DC power adapter through the barrel connector. If the device is connected to both the DC power adapter and the PoE adapter, then the DC power adapter takes precedence.

Accessing the device

This section includes the following topics:

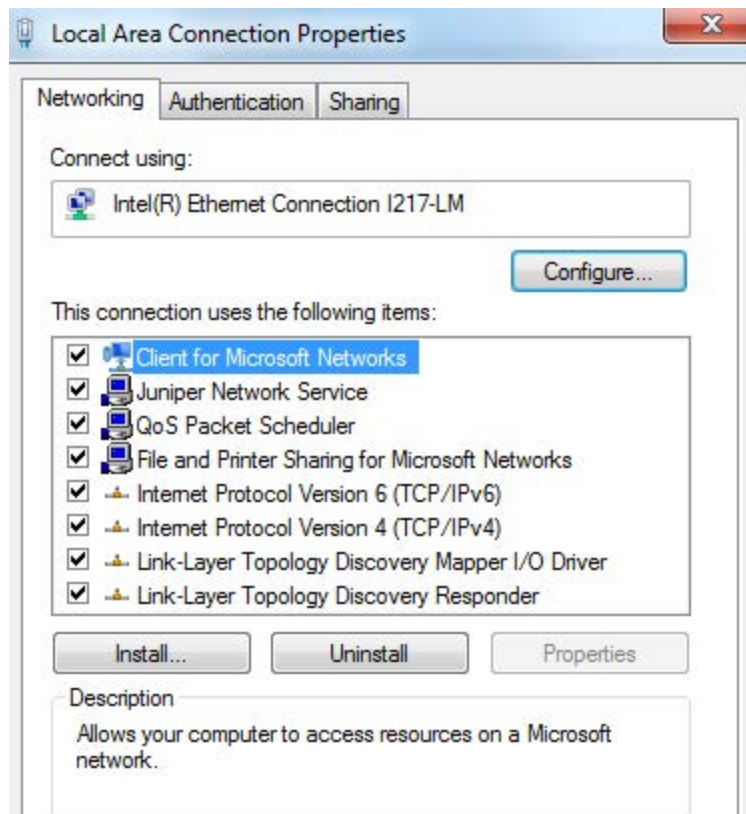

- [Device access using default/fallback IP](#)
- [Device access using zeroconf IP](#)
- [Device access using DHCP IP address](#)

Once the device is powered up ensure the device is up and running before you try to access it based on LED status. The power LED on the Enterprise Wi-Fi AP device should turn Green which indicates that the device is ready for access.

Device access using default or fallback IP

To configure the computer to access the device using the default or fallback IP, perform the following steps:

1. Open **Local Area Connection Properties** by performing one of the following steps:
 - In computers running the Windows 7 operating system, go to **Control Panel > Network and Internet > Network Connections > Local Area Connection > Properties** (in the **Local Area Connection Status** window).
 - In computers running the Windows 10 operating system, go to **Control Panel > Network and Internet > Network and Sharing Center > Local Area Connection > Properties** (in the **Local Area Connection Status** window).

The Enterprise Wi-Fi AP obtains its IP address from a DHCP server. A default IP address of 192.168.0.1/24 is used if an IP address is not obtained from the DHCP server.

2. Select **Internet Protocol Version 4 (TCP/IPv4)** and click **Properties**.

The **Internet Protocol Version 4 (TCP/IPv4) Properties** dialog box appears, as shown below.:

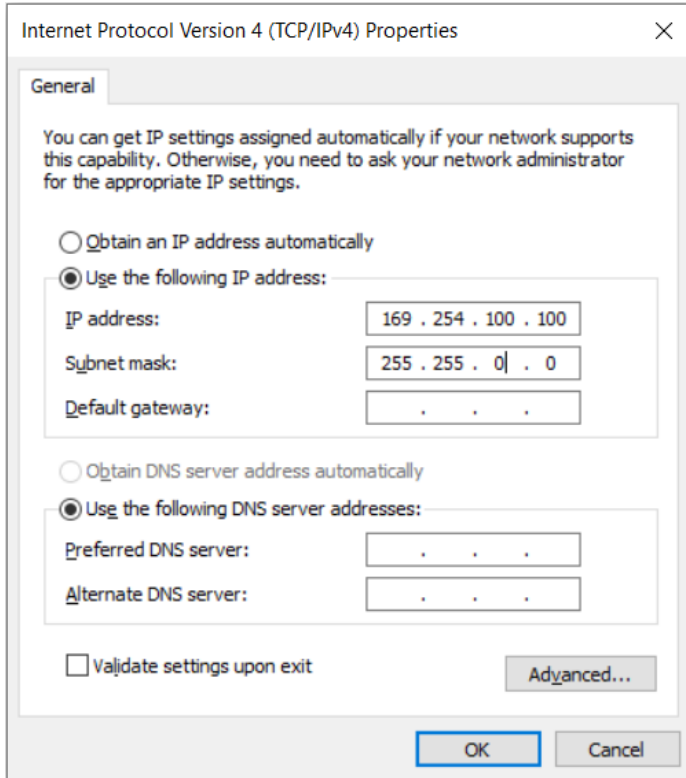

3. In the **Use the following IP address** section, ensure that an appropriate IP address and a subnet address are provided.
4. Click OK.
5. Ensure that your computer is set up to communicate with the required range of IP addresses.
6. Open a web browser and type the URL - <http://192.168.0.1> - to access the device UI. The Sign In page appears.
7. Type an appropriate username and password.
 - Default username: admin
 - Default password: admin
8. Click **Sign In**.

Device access using zeroconf IP

To configure the computer to access the device using the zeroconf IP, complete the following steps:

1. Convert the last two bytes of ESN of the device to decimal. If ESN is 58:C1:CC:DD:AA:BB, last two bytes of this ESN is AA:BB. Decimal equivalent of AA:BB is 170:187. Zeroconf IP of the device with ESN 58:C1:CC:DD:AA:BB is 169.254.170.187.
2. Configure Management PC with 169.254.100.100/16, as described below:

3. Access the device UI using <http://169.254.170.187> with default credentials as below:
 - Username: admin
 - Password: admin

Device access using DHCP IP address

To access the device using DHCP IP address, follow the below steps:

1. Plugin the device to the network.
2. Obtain the IP address of the device from the system administrator.
3. Access the device UI using <http://<IP address>> and default credentials, as listed below:
 - Username: admin
 - Password: admin

LED status

The Enterprise Wi-Fi AP has a single-color LED. The power LED glows amber as the AP boots up and turns Green once it has booted up successfully. The network or status LED glows green if the connection to XMS or cnMaestro controller or manager is down and turns blue once the AP is connected successfully to XMS or cnMaestro.

Table 5: Enterprise Wi-Fi AP LED status

LED Color	Status Indication
	<p>The device is booting up.</p>  <div data-bbox="573 359 1419 478" style="border: 1px solid black; background-color: #e1f5fe; padding: 5px;"> <p>Note: If these LEDs remain amber for more than five minutes, this indicates that the device has failed to boot.</p> </div>
	<ul style="list-style-type: none"> • The device is successfully up and accessible. • Wi-Fi services are up, if configured.
	<p>XMS or cnMaestro connection is successful.</p>

Chapter 2: Onboarding the Device

This chapter describes the following topics:

- [Overview](#)
- [Device Onboarding and Provisioning](#)
 - [cnMaestro](#)
 - [XMS-Cloud](#)
 - [Swift](#)

Overview

By default, support is available for all the devices at <https://cloud.cambiumnetworks.com>, no user action is required to direct devices to contact either cnMaestro Cloud or XMS-Cloud. You can onboard and provision devices without any additional setup.

If you are using cnMaestro On-Premises, you must direct the devices to connect to the cnMaestro server using DHCP options or static URL configuration. For more information, refer to the *cnMaestro On-Premises User Guide*.

Device onboarding and provisioning

Enterprise Wi-Fi APs support the following onboarding methods:

cnMaestro

cnMaestro is a simple next-generation network management system for Cambium Networks wireless and wired solutions.

For onboarding devices to cnMaestro, refer to the *cnMaestro User Guide*.

Supported devices and minimum version

The following table lists the minimum release version of every Enterprise Wi-Fi APs that is required to be managed by cnMaestro Cloud and On-Premises. It also lists the minimum version of cnMaestro On-Premises required to manage the respective APs.

Note

The AP version is the minimum version required to manage them using cnMaestro Cloud and On-Premises.

Similarly, the cnMaestro On-Premises version is the minimum version required to manage the APs.

Table 6: Supported minimum AP and cnMaestro versions

AP Model	Supported Minimum AP Version		Supported Minimum cnMaestro On-Premises Version
	For cnMaestro Cloud	For cnMaestro On-Premises	
XE3-4	6.4	6.4	3.1.0
XE3-4TN	6.5.1	6.5.1	3.2.0
XE5-8	6.4.1	6.4.1	3.1.1
XV2-2	6.1	6.1	2.4.1
XV2-2T0	6.4	6.4	3.1.0
XV2-2T1	6.4.1	6.4.1	3.1.1
XV2-21X	6.5	6.5	3.1.1
XV2-22H	6.5	6.5	3.1.1
XV2-23T	6.5	6.5	3.1.1
XV3-8	6.0	6.0	2.4.1

XMS-Cloud

XMS-Cloud makes it easy to manage networks from a single, powerful dashboard. Zero-touch provisioning and centralized, multi-tenant network orchestration simplifies network management functions. XMS-Cloud helps manage Cambium Enterprise Wi-Fi devices.

For onboarding devices to XMS-Cloud, refer to <https://www.youtube.com/watch?v=qD-nPsdRc4Y>.

Swift

The Swift mobile application provides cloud-based management of your Enterprise networks. It is targeted towards smaller enterprises and does not require extensive networking expertise to deploy and use. You can configure your networks in a few taps and get the most relevant statistics at your fingertips.

The **Cambium Networks Swift** application is available for Android at (<https://play.google.com/store/apps/details?id=com.cambiumnetworks.swift>) and for iOS at (<https://apps.apple.com/in/app/cambium-networks-swift/id1503771752>).

You can also use the following QR codes to download the Swift application:

Chapter 3: Using the UI

You can manage Enterprise Wi-Fi AP devices using the on-device user interface (UI), which is accessible from any network device. This chapter explains how to access the UI.

This chapter describes the following topics:

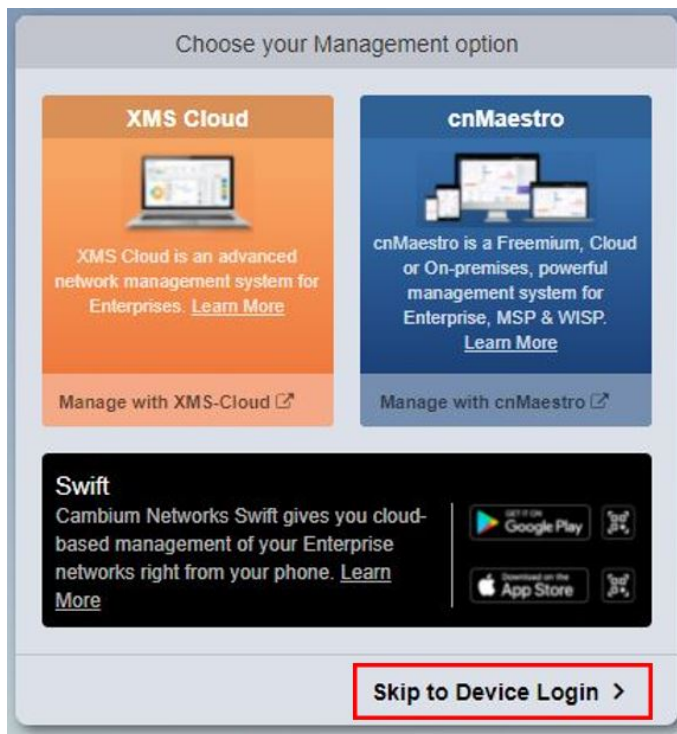

- [Logging into the UI](#)
- [Viewing the Home page \(dashboard\)](#)

Logging into the UI

You can manage the devices using either of the management options (Figure 4) or directly using the device login (Chapter 3).

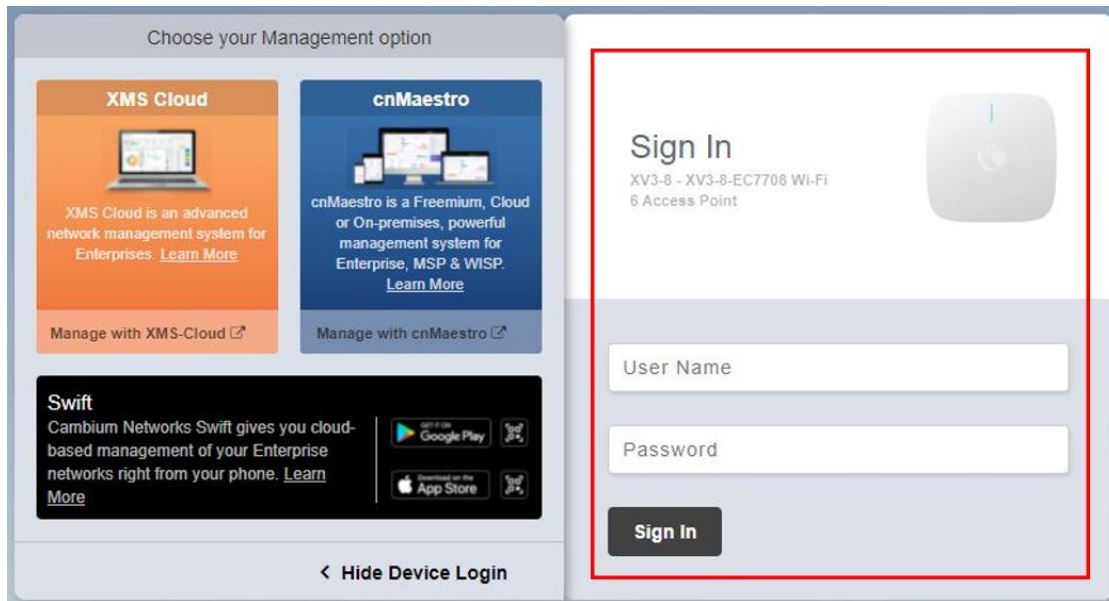

- To manage the device, select one of the following management options, as shown in Figure 4:
 - XMS-Cloud
 - cnMaestro

Figure 4: The Management option page

- To login to the device login page, click **Skip to Device Login**. The **Sign In** tab appears, as shown in Chapter 3.

Figure 5: The device login page

Enter the following credentials:

- User Name: admin
- Password: admin

Viewing the home page (dashboard)

On logging into the Enterprise Wi-Fi AP login page, the home page (dashboard) is displayed. Figure 6 shows the elements that are displayed on the Enterprise Wi-Fi AP home page.

Figure 6: The Enterprise Wi-Fi AP home page (dashboard)

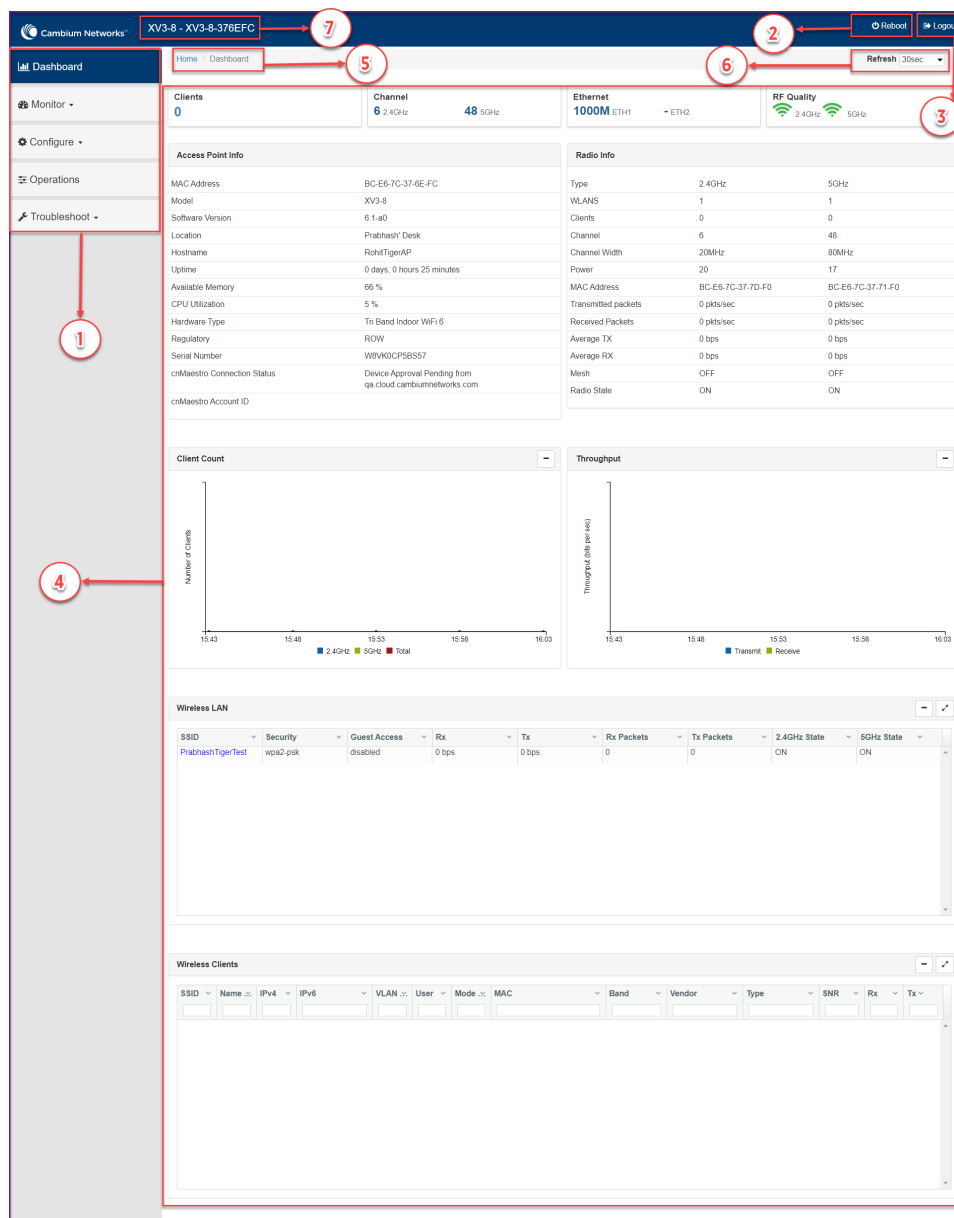

Table 7: Elements in the Enterprise Wi-Fi AP dashboard

Number	Element	Sub-Element	Description
1	Menu	-	Contains multiple tabs that help the user to configure, monitor, and troubleshoot the Enterprise Wi-Fi AP device. The menu consists of the following options: <ul style="list-style-type: none"> • Monitor • Configure

Number	Element	Sub-Element	Description
			<ul style="list-style-type: none"> • Operations • Troubleshoot
2	Reboot	-	Restarts the Enterprise Wi-Fi AP device ().
3	Logout	-	Sign out user from the Enterprise Wi-Fi AP device ().
4	Content	-	<p>Contains details of configuration, statistics, or provision to configure Enterprise Wi-Fi AP device.</p> <p>Information displayed here varies based on the tab selected in the Menu section.</p>
		RF Quality	<p>Displays the device radio RF Quality Index that provides an indication of the RF link quality of wireless clients, or mesh clients, or both as seen by the AP's radio. It is the average of all the wireless clients and or mesh clients SNR.</p> <p>Following are the interpretation of the bars in the image:</p> <ul style="list-style-type: none"> • Aggregate SNR is more than 45: RF Quality Index is displayed as Excellent • Aggregate SNR is more than 35 but less than 45: RF Quality Index is displayed as Good • Aggregate SNR is more than 25 but less than 35: RF Quality Index is displayed as Average • Aggregate SNR is less than 25: RF Quality Index is displayed as Poor
5	UI path	-	Provides UI navigation path information to the user.
6	UI refresh interval	-	Provision to reload updated statistics at regular intervals.
7	Model number	-	Displays the model number of the AP and the configured hostname.

Monitor

The **Monitor** section provides information such as current configuration, traffic statistics across all interfaces configured on the device, and the details about that device. Based on information provided in this section, it is categorized and displayed under the following sections:

- **System:** Provides information related to Enterprise Wi-Fi AP device such as software image, hostname, and country code.

- **Radio:** Provides information such as RF statistics, neighbour list, and current radio configuration of the device.
- **WLAN:** Provides information on WLANs.
- **Network:** Provides information related to interfaces such as default route and interface statistics.
- **Services:** Provides information related to entities that support Bonjour.

Configure

This section allows users to configure various parameters on the Enterprise Wi-Fi AP devices based on deployment requirements. The **Configure** tab contains the following sections:

- **System:** Provision to configure system UI parameters.
- **Radio:** Provision to configure radio settings (2.4 GHz/5 GHz).
- **WLAN:** Provision to configure WLAN parameters as per the end user requirements and type of wireless station.
- **Network:** Provides information related to VLAN, routes, and Ethernet ports.
- **Services:** Provides information related to network and Bonjour gateway.

Operations

This section allows users to perform the following maintenance tasks on devices:

- **Firmware update:** Provision to upgrade software for the Enterprise Wi-Fi AP devices.
- **System:** Provides different methods of debugging field issues and recovering devices.
- **Configuration:** Provision to modify the configurations of a device.

Troubleshoot

This section allows users to debug and troubleshoot the devices remotely. The **Troubleshoot** tab contains the following sections:

- **Wi-Fi Analyzer:** Provides information related to air quality.
- **Connectivity:** Provides different modes of network reachability for the Enterprise Wi-Fi AP device.
- **Packet Capture:** Provides feasibility for the user to capture packets on operational interfaces.
- **Logs:** Supports the feasibility to check logs for different modules of Enterprise Wi-Fi AP devices. These logs help the customer to debug an issue.

Chapter 4: Configuring the System

This chapter describes the following topics:

- [Basic](#)
- [Management](#)
- [Time settings](#)
- [Event Logging](#)
- [SNMP](#)

Basic

Table 8 lists configurable system parameters that are available under **Configuration > Basic** tab in the cnMaestro UI:

Table 8: Basic parameters

Parameter	Description	Range	Default
Name	Hostname of the device. Supported maximum length of the hostname: 64 characters	-	Enterprise Wi-Fi AP Model Number-Last 3 Bytes of ESN
Location	Location where the device is placed. Supported maximum length of location: 64 characters	-	-
Contact	Contact information for the device.	-	-
Country-Code	Country of operation of the device. To be set by the administrator only. The allowed operating channels and the respective transmit power levels depend on the country of operation. The list of countries supported depends on the SKU of the device (FCC and ROW). Note: Radios remain disabled unless this parameter is configured.	-	-
Placement	Enterprise Wi-Fi AP device supports both Indoor and Outdoor deployments. Based on deployment user can configure it as follows: <ul style="list-style-type: none">• Indoor: Only indoor channels for configured country code will be available and operational.• Outdoor: Only outdoor channels for configured country code will be available and operational.	-	Indoor

Parameter	Description	Range	Default
PoE Output	Enable power over Ethernet to an auxiliary device connected to PoE OUT port.	-	Off
Dual 5 GHz radio	Enable Dual 5 GHz radio. This parameter provides the flexibility of splitting 8x8 5 GHz radio into two 4x4 5 GHz radios.	-	Disabled
LED	When enabled, turns on the device LEDs during operation.	-	Enabled
LLDP	Advertises device capabilities and information in the L2 network.	-	Enabled
Channels Distribution	Allows unique distribution of channels across radios when multiple radios are configured with same frequency band. Note: This option is available only as a CLI-based configuration. Use the <code>channels-distribution</code> command.	-	Enabled
Default Power Policy	Provision to configure current power policy.	-	Sufficient
Power Force Type	Provision to configure power force type.	-	None

Figure 7: The System page

Basic Information

Type
Enterprise Wi-Fi (E-Series, XE/XV-Series)

Name*
XV3-8-EC7708

Auto Sync Automatically push configuration changes to devices sharing this AP Group

Country*
India For appropriate regulatory configuration

Location
Location where this device is placed (max 64 characters)

Contact
Contact information for the device (max 64 characters)

Description

Placement
 Indoor Outdoor Configure the AP placement details

PoE Output
Off Enable Power over Ethernet to an auxiliary device connected to PoE OUT port

LED Whether the device LEDs should be ON during operation

LLDP Whether the AP should transmit LLDP packets

System

Name	XV3-8-EC7708	Hostname of the device (max 64 characters)
Location		Location where this device is placed (max 64 characters)
Contact		Contact information for the device (max 64 characters)
Country-Code	India	For appropriate regulatory configuration
Placement	<input checked="" type="radio"/> Indoor <input type="radio"/> Outdoor	Configure the AP placement details
Dual 5GHz radio	<input type="checkbox"/>	Splits 8x8 5 GHz radio to two 4x4 5 GHz radios
LED	<input checked="" type="checkbox"/>	Whether the device LEDs should be ON during operation
LLDP	<input checked="" type="checkbox"/>	Whether the AP should transmit LLDP packets
Default Power Policy	Sufficient	Configure default power policy
Power Force Type	None	Configure power force type

To configure the above parameters, navigate to the **Configuration > Basic** tab and provide the details, as given below:

1. Enter the hostname of the device in the **Name** textbox.
2. Enter the location where this device is placed in the **Location** textbox.
3. Enter the contact details of the device is placed in the **Contact** textbox.
4. Select the appropriate country code for the regulatory configuration from the **Country-Code** drop-down list.
5. Select the **Placement** checkbox parameter Indoor or Outdoor to configure the AP placement details.
6. Enable **Dual 5 GHz radio** checkbox.
7. Enable the **LED** checkbox.
8. Enable the **LLDP** checkbox.
9. Select **Default Power Policy** from the drop-down list.
10. Select **Power Force Type** from the drop-down list.
11. Click **Save**.

Power over Ethernet (PoE) in

Enterprise Wi-Fi APs first attempt to detect the type and classification of the Power Source (PS) they are being powered by using standard hardware handshake and control logic. Some PS devices are the passive type, like the Cambium PoE power injectors, and therefore the AP cannot detect the type or classification of the PS they are being powered by. For this reason, Enterprise Wi-Fi APs also use LLDP power negotiation to request a specific amount of PoE power from the PS. This feature in the Enterprise Wi-Fi APs is called LLDP power request and it is enabled by default.

The following table lists the PoE power requirements for the Enterprise Wi-Fi APs:

Table 9: PoE power requirements for the APs

Device	PoE Out	Recommended Force Type		Maximum Power Draw (Watts)	Minimum Power Required (Watts)	With Minimum Watts Hardware Capability			
		With PoE Out	Without PoE Out			BT(BLE)	USB	ZigBee	Radio
XE3-4TN	Yes (Max 30W)	802.3bt8	802.3at	64	11	Disabled	-	-	Enabled
XV2-2	No	-	802.3at	21	7.6	-	Disabled	-	Enabled
XV2-2T0	Yes (Max 30W)	802.3bt6	802.3at	51	8.9	Disabled	-	-	Enabled
XV2-2T1	Yes (Max 30W)	802.3bt6	802.3at	51	8.9	Disabled	-	-	Enabled

Device	PoE Out	Recommended Force Type		Maximum Power Draw (Watts)	Minimum Power Required (Watts)	With Minimum Watts Hardware Capability			
		With PoE Out	Without PoE Out			BT(BLE)	USB	ZigBee	Radio
XV2-21X	No	-	802.3af	12.95	6	-	-	-	Enabled
XV2-22H	Yes (Max 10W)	802.3at	802.3af	22.95	6	Disabled	-	Disabled	Enabled
XV2-23T	No	-	802.3af	12.95	6	-	-	-	Enabled
XV3-8	No	-	802.3bt	35	10.4	Disabled	Disabled	-	Enabled
XE3-4	No	-	802.3bt	28	9.4	Disabled	Disabled	-	Enabled
XE5-8	No	-	802.3bt	51	11.5	Disabled	Disabled	-	Enabled

Figure 8: Power policy configuration

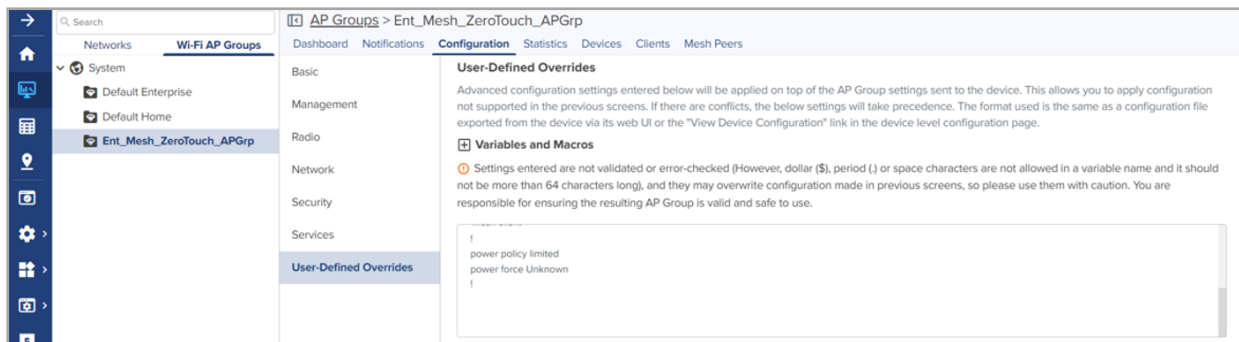

Table 10 lists the Cambium PoE injectors and cnMatrix models supported on the APs.

Table 10: Supported Cambium PoE Injectors and cnMatrix models

AP Model	Cambium PoE Injector	cnMatrix Recommended Model
XE3-4TN	N000000L142A	
XV2-2	N000000L142A	EX3028R-P / EX3052R-P / EX2016M-P

XE5-8	N000000L142A	EX3028R-P / EX3052R-P / EX2016M-P

Attention

Configure Power policy and power force type based on the input power source.

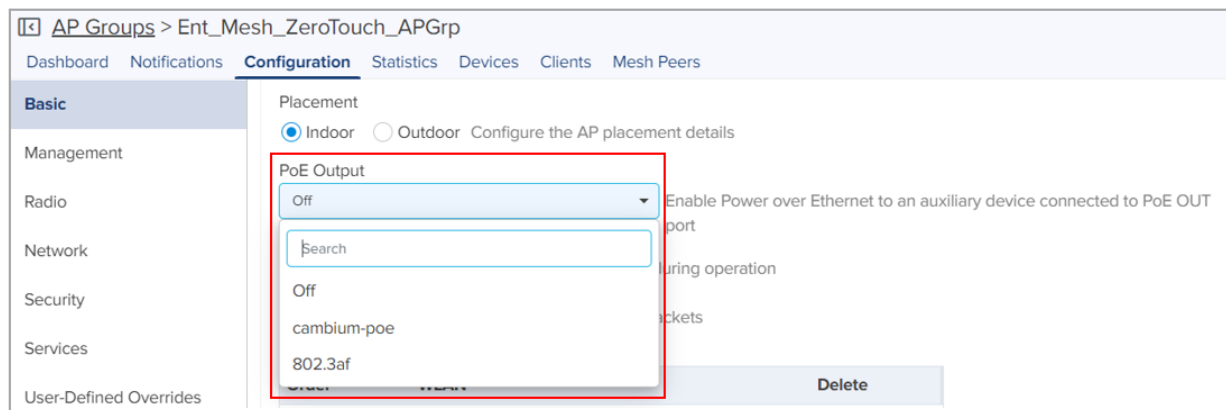

Power over Ethernet (PoE) Out port

PoE out provision is provided to power on devices that are compatible with IEEE802.3af/at PoE IN as per power consumption or Cambium 30v POE as shown in the below table.

Table 11: PoE-out capabilities

AP Model	10W	48V @ 15W	48V @ 30W	30V @ 30W	Default State
XV2-2T0		✓	✓	✓	Disabled
XV2-2T1		✓	✓	✓	Disabled
XV2-22H	✓				Disabled
XE3-4TN		✓	✓	✓	Disabled

Figure 9: PoE Output cnMaestro configuration

Link Layer Discovery Protocol (LLDP)

LLDP is a Layer 2 network protocol used to share information (such as the device manufacturer and model, network capabilities, IP address etc.) with other directly connected network devices. APs can both advertise their presence by sending LLDP announcements and can also collect and display information sent by neighbors.

LLDP settings are enabled by default on AP. This implies power negotiation is also enabled over LLDP when an AP is powered by a Power over Ethernet (PoE) PSE switch port.

This window allows you to establish your LLDP settings. Use the **Save** button if you want to save the settings.

Power negotiation

LLDP discovers a device port (connected to a PoE PSE switch, for example) that supplies power to this AP. The AP checks that the port can supply the maximum power that is required by this AP model. AP sends the required maximum power (in watts) via LLDP frames to the PoE source and expects the PoE source to reply with the amount of power that can be allocated.

- If the AP receives a response confirming that the power allocated by the PoE PSE source is equal to or greater than the maximum power requested then the AP enables radios and other Model Specific peripherals (USB port, Bluetooth etc.).
- If the AP receives power allocation less than the maximum but more than the minimum to keep the radios operational then AP issues a Syslog message and shuts down the other peripherals (USB port, Bluetooth etc.).
- If the AP receives lesser than the minimum power for radios to operate in that case the radios are shut down for five minutes and power LLDP power negotiation continues to monitor available power to be minimum for AP radios to function.
- Click to check power status: `show power`

This provides a more graceful way of handling an underpowered situation on a Wi-Fi device. When the radios are turned off, XMS can notify you so that you don't have to hunt down an intermittent problem.

CLI Configuration

Consider the following tasks to configure the CLI:

To enable:

```
XV3-8-EC7708(config)# lldp
XV3-8-EC7708(config)#
```

To disable:

```
XV3-8-EC7708(config)# no lldp
XV3-8-EC7708(config)#
```

To list LLDP configuration:

```
show lldp configuration
show lldp interfaces
```

Request power

To enable/disable power negotiation via LLDP:

```
XV3-8-EC7708(config)# lldp
request-power : Enable power negotiation (default:enabled)
tx-hold : Set transmit hold multiplier (default:4, used to calculate the time-to-live
(tx-interval * tx-hold))
tx-interval : Set LLDP packet transmit delay (in Sec, default:30 sec)
XV3-8-EC7708(config)# lldp request-power
<ENTER>
XV3-8-EC7708(config)# lldp request-power
```

Transmit hold

It is used to compute the Time To Live (TTL) value. This is the time during which the receiving device maintains information before the validity of information expires.

```
XV3-8-EC7708(config)# lldp
request-power : Enable power negotiation (default:enabled)
tx-hold : Set transmit hold multiplier (default:4, used to calculate the time-to-live
(tx-interval * tx-hold))
tx-interval : Set LLDP packet transmit delay (in Sec, default:30 sec)
XV3-8-EC7708(config)# lldp tx-hold
Specify transmit hold multiplier value (max 65535)
```

Transmit interval

It is the time interval between two regular LLDP packets transmissions. The AP sends out LLDP announcements, advertising its presence at this interval. The default value is 120 seconds.

```
XV3-8-EC7708(config)# lldp
request-power : Enable power negotiation (default:enabled)
tx-hold : Set transmit hold multiplier (default:4, used to calculate the time-to-live
(tx-interval * tx-hold))
tx-interval : Set LLDP packet transmit delay (in Sec, default:30 sec)
XV3-8-EC7708(config)# lldp tx-interval
Specify LLDP transmit delay in sec (max 65535)
```

Management

Administrator Access

Table 12 lists configurable fields that are displayed in the **Configuration > System > Management > Administrator Access** tab:

Table 12: Administrator Accessparameters

Parameter	Description	Range	Default
Admin Password	Password for authentication of UI and CLI sessions.	-	admin
Telnet	Enables Telnet access to the device CLI.	-	Disabled
SSH	Enables SSH access to the device CLI.	-	Enabled
SSH Key	Provision to login to device using SSH Keys. The user needs to add Public Key in this section. If configured, the user has to login to AP using Private Keys. This is applicable for both CLI and GUI.	-	Disabled
HTTP	Enables HTTP access to the device UI.	-	Enabled
HTTP Port	Provision to configure HTTP port number to access device UI.	1-65535	80
HTTPS	Enables HTTPS access to the device UI.	-	Enabled
HTTPS Port	Provision to configure HTTPS port number to access device UI.	1-65535	443
RADIUS Mgmt Auth	User has provision to control login to AP using RADIUS authentication. If enabled, every credential that is provided by the user undergo RADIUS authentication. If successful, allowed to login to UI of the device. This is applicable for both CLI and GUI.	-	Disabled
RADIUS Server	Provision to configure RADIUS IPv4 server for Management Authentication.	-	-
RADIUS Secret	Provision to configure RADIUS shared secret for Management authentication.	-	-
cnMaestro			
Cambium Remote Mgmt.	Enables support for Cambium Remote Management of this device.	-	Enabled
Validate Server Certificate	This allows HTTPs connection between cnMaestro and Enterprise Wi-Fi AP device.	-	Enabled
cnMaestro URL	Static provision to onboard devices either using IPv4 URL.	-	-
Cambium ID	Cambium ID is used for provisioning cnMaestro (Cambium Remote Management) of this device.	-	-
Onboarding Key	Password used for onboarding the device to cnMaestro.	-	-

Figure 10: Administrator Accesspage

Administrator Access

Admin Password
..... Configure password for authentication of GUI and CLI sessions (max 32 characters)

 Change your password, do not use default passwords!

Telnet Enable Telnet access to the device CLI

SSH Enable SSH access to the device CLI

SSH Key
..... Use SSH keys instead of password for authentication

HTTP Enable HTTP access to the device GUI

HTTP Port
80 Port for HTTP access to the device GUI (1-65535)

HTTPS Enable HTTPS access to the device GUI

HTTPS Port
443 Port for HTTPS access to the device GUI (1-65535)

RADIUS Mgmt Authentication Enable RADIUS authentication of GUI/CLI sessions

RADIUS Server
..... RADIUS server IP/Hostname

RADIUS Secret
..... RADIUS server shared secret

To configure the above parameters, navigate to the **Configuration > System** tab and provide the details as given below:

1. Enter the admin password of the device in the **Admin Password** textbox.
2. Enable the **Telnet** checkbox to enable telnet access to the device CLI.
3. Enable the **SSH** checkbox to enable SSH access to the device CLI.
If certificate-based login is required, enter SSH Key in the textbox else select
4. Enable the **HTTP** checkbox to enable HTTP access to the device UI.
5. If a custom port other than the default is required, enter the **HTTP port** number value for HTTP access in the textbox.
6. Enable the **HTTPS** checkbox to enable HTTPS access to the device UI.
7. If a custom port other than the default is required, enter the **HTTP port** number value for HTTP access in the textbox.
8. If RADIUS-based login is required, enable **RADIUS Mgmt Auth** checkbox and enter the details of RADIUS server as follows:

- a. Enter the **RADIUS Server** parameter in the textbox.
- b. Enter the **RADIUS Secret** parameter in the textbox.

To configure **cnMaestro**:

1. Enable **Remote Management** checkbox to support for Cambium Remote Management of this device.
2. Enable **Validate Server Certificate** checkbox to support HTTPS connection between cnMaestro and Enterprise Wi-Fi AP.
3. Enter the URL for cnMaestro in the **cnMaestro URL** textbox.
4. Enter the Cambium ID of the user in the **Cambium ID** textbox.
5. Enter the onboarding Key in the **Onboarding Key** textbox.

HTTPS Proxy server configuration

The proxy management service is established in the AP to proxy management of traffic for remote management services originating from the AP.

For zero-touch configuration, refer to [DHCP Option 43 - Zero-touch onboarding](#).

CLI Configuration:

```
XV3-8-EC7708(config)# management proxy
https : Enable HTTPS proxy support
XV3-8-EC7708(config)# management proxy https
host : Configure HTTPS proxy host
password : Configure HTTPS proxy password
port : Configure HTTPS proxy port
username : Configure HTTPS proxy username
```

Time settings

User can configure up to two NTP servers. These are used by the AP to set its internal clock to respective time zones configured on the device. While powering ON the AP, the clock resets to default and resyncs the time as the Enterprise Wi-Fi AP does not have battery backup. The servers can be specified as IPv4 address or as a hostname (Example: pool.ntp.org). If NTP is not configured on the device, the device synchronizes time with cnMaestro if onboarded.

[Table 13](#) lists the fields that are displayed in the **Configuration > Management > Time Settings** section.

Table 13: Time Setting parameters

Parameter	Description	Range	Default
Time zone	The time zone can be set according to the location where the AP is installed. Selecting the appropriate time zone from the drop-down list, ensures that the device clock is synced with the wall clock time.	-	-

Parameter	Description	Range	Default
	 <div style="border: 1px solid #ccc; background-color: #e6f2ff; padding: 5px; display: inline-block;"> Note Accurate time on the AP is critical for features such as WLAN Scheduled Access, and Syslogs. </div>		
NTP Server 1	Name or IPv4 address of a Network Time Protocol server 1.	-	-
NTP Server 2	Name or IPv4 address of a Network Time Protocol server 2.	-	-

Figure 11: Time setting page

Time Settings

Time Zone
 Configure Time Zone

NTP Server 1
 Name or IP Address of Network Time Protocol Server

NTP Server 2

To configure the above parameters, navigate to the **Configuration > Management > Time Settings** tab and provide the details as given below:

1. Select the time zone settings for the AP from the **Time Zone** drop-down list.
2. Enter the name or IPv4 address of the **NTP server 1** in the textbox.
3. Enter the name or IPv4 address of the **NTP server 2** in the textbox.
4. Click **Save**.

Event logging

The Enterprise Wi-Fi AP devices support multiple troubleshooting methods. Event logging or Syslog is one of the standard troubleshooting processes. If you have a Syslog server in your network, you can enable it on an Enterprise Wi-Fi AP device.

Table 14 lists the fields that are displayed in the **Configuration > System > Event Logging** section.

Table 14: Event logging parameters

Parameter	Description	Range	Default
Syslog Server 1	Hostname or IPv4 address of the Syslog server and respective port number.	-	514
Syslog Server 2	Hostname or IPv4 address of the Syslog server and respective port number.	-	514
Syslog Severity	Provision to configure severity of Logs that must be forwarded to the server. The Log levels supported are as per RFC.	-	Debug

Figure 12: Event logging page

Event Logging

Syslog Server1 Port

Name or IPv4/IPv6 address of syslog server

Syslog Server2 Port

Syslog Severity

Specify severity of events forwarded to Syslog servers

To configure the above parameters, navigate to the **Configuration > Management > Event Logging** tab and provide the details as given below:

1. Enter the FQDN or IPv4 address of the **Syslog Server 1** along with a customized port number in the textbox. If the port number is not entered, AP will take the default value as 514.
2. Enter the FQDN or IPv4 address of the **Syslog Server 2** along with a customized port number in the textbox. If the port number is not entered, AP will take the default value as 514.
3. Select the **Syslog Severity** from the drop-down list.
4. Click **Save**.

A maximum of two Syslog servers can be configured on an Enterprise Wi-Fi AP device. Events are sent to both configured Syslog servers if they are up and running.

SNMP

Table 14 lists the fields that are displayed in the **Configuration > Management > SNMP** section.

Table 15: SNMP parameters

Parameter	Description	Range	Default
Enable	Provision to enable SNMPv2 or SNMPv3 support on the device	-	-
SNMPv2c RO community	SNMP v2c read-only community string.	-	public
SNMPv2c RW community	SNMP v2c read-write community string.	-	private
Trap Receiver IP	Provision to configure SNMP trap receiver IPv4 server.	-	-
SNMPv3 Username	Enter the username for SNMPv3.	-	-
SNMPv3 Password	Enter the password for SNMPv3.	-	-
Authentication	Provision to choose the authentication type as MD5 or SHA.	-	MD5
Access	Provision to choose Access type as RO or RW.	-	RO
Encryption	Choose ON or OFF.	-	ON

Figure 13: SNMP parameters

The screenshot shows the SNMP configuration page. At the top, there is a section titled "SNMP" with a collapse icon. Below it, there is a checkbox labeled "Enable" with the text "Enable SNMP support on the device". The checkbox is checked. Below this, there are three text input fields: "SNMPv2c RO Community" with the value "public", "SNMPv2c RW Community" with the value "private", and "Trap Receiver IP" with the value "xxx.xxx.xxx.xxx". Each field has a description to its right: "SNMPv2c read-only community string (max 64 characters)", "SNMPv2c read-write community string (max 64 characters)", and "SNMP trap server IP address". Below these are two more text input fields: "SNMPv3 Username" and "SNMPv3 Password". The "SNMPv3 Password" field has a "Show" button next to it. Descriptions for these fields are "SNMPv3 user name (max 32 characters)" and "SNMPv3 password (8 to 32 characters)". At the bottom, there are three sections: "Authentication" with radio buttons for "MD5" (selected) and "SHA"; "Access" with radio buttons for "Read-Only" (selected) and "Read-Write"; and "Encryption" with radio buttons for "On" (selected) and "Off".

To configure the above parameters, navigate to the **Configuration > Management > SNMP** tab and provide the details, as given below:

1. Select **Enable** checkbox to enable SNMP functionality.
2. Enter the SNMP v2c read-only community string in the **SNMPv2c RO community** textbox.
3. Enter the SNMP v2c read-write community string in the **SNMPv2c RW community** textbox.
4. Enter the **Trap Receiver IPv4** (Currently Cambium supports SNMP only v1 and v2c Traps) in the textbox.
5. Enter the SNMP V3 username in the **SNMPv3 Username** textbox.
6. Enter the SNMP V3 password in the **SNMPv3 Password** textbox.
7. Select MD5 or SHA from the **Authentication** checkbox.
8. Select RO or RW from the **Access** checkbox.
9. Select ON or OFF from the **Encryption** checkbox.
10. Click **Save**.

Chapter 5: Configuring the Radio

This chapter describes the following topics:

- [Overview](#)
- [Configuring Radio parameters](#)
- [BSS coloring](#)
- [Target Wake Time \(TWT\)](#)
- [Receive sensitivity configuration](#)
- [Multicast-snooping and Multicast-to-Unicast conversion](#)

Overview

Enterprise Wi-Fi AP devices support numerous configurable radio parameters to enhance the quality of service as per the deployment.

Configuring Radio parameters

The XV3-8 Tri-Band Indoor Wi-Fi 6 AP can operate in either Dual Band Simultaneous (DBS) or Single Band Simultaneous (SBS). This feature provides the flexibility of splitting 5 GHz radio into two independently configurable and operational radios. In DBS mode, 5 GHz radio operates as single radio with an 8x8 configuration. In SBS mode, 5 GHz Radio operates as split radio with each 4x4 configuration. Configurable parameters under the **Radio** profile are listed below:

- [Basic](#)
- [Enhanced Roaming](#)

Basic

The following table lists configurable fields that are displayed in the **Configuration > Radio > Basic** tab:

Table 16: Configure Radio parameters

Parameter	Description	Range	Default
Radio			
Enable	Enables the operation of radio.	-	Enabled
Band	If any radio supports multiple bands then the user can select one of the bands.	-	-
Channel	The user can select the channel from the drop-down list. Channels in the drop-down list are populated based on the Country selected in Configuration > System UI .	<ul style="list-style-type: none">• 2.4 GHz: 1 - 14• 5 GHz: 36 - 173• 6 GHz: 1 - 233	Auto

Parameter	Description	Range	Default
Channel Width	<p>The user can select the following channel widths for the operation:</p> <ul style="list-style-type: none"> For 2.4 GHz: Only 20 MHz channel width is supported. For 5 GHz: 20 MHz, 40 MHz, 80 MHz, and 160 MHz channel width are supported. Note: Please refer Chapter 5 for 160 MHz support with 5 GHz. For 6 GHz: 20 MHz, 40 MHz, 80 MHz, and 160 MHz channel width are supported. 	-	20 MHz
Transmit Power	<p>The user can configure transmit power of each radio based on coverage and SLA. Unit of transmit power is in dBm and its range is from 4 to 30. The maximum transmit power of Enterprise Wi-Fi AP devices varies based on model number. More details of transmit power supported by each Enterprise Wi-Fi AP device are available at https://www.cambiumnetworks.com/products/wifi/. Transmit power drop-down box varies as per the country selected in Configuration > System UI. The default value is AUTO, which means radio transmit power is configured to the maximum as per the country configured selected in the Configuration > System UI.</p>	<ul style="list-style-type: none"> 2.4 GHz: 4 - 30 5 GHz: 4 - 30 6 GHz: 4 - 30 	Auto
Beacon Interval	The user can configure time duration between two consecutive Beacons. It is termed as Beacon interval.	50ms - 3400ms.	100
Minimum Unicast rate	Provision to adjust the coverage area of Enterprise Wi-Fi AP device. Higher the rate selected, the lesser the range. The user can configure this value based on SLA in deployment. The drop-down list contains all values that are advertised by Enterprise Wi-Fi AP devices which include legacy, HT, and VHT rates.	Standard 802.11b and 802.11g data rates	1Mbps
Candidate Channels	<p>Enterprise Wi-Fi AP provides the user to configure selective channels based on their requirement. Options vary based on a band of operation and are as follows:</p> <ul style="list-style-type: none"> For 2.4 GHz: <ul style="list-style-type: none"> All Specific For 5 GHz: 	<ul style="list-style-type: none"> 2.4 GHz: 1 - 14 5 GHz: 36 - 173 6 GHz: 1 - 233 	All

Parameter	Description	Range	Default
	<ul style="list-style-type: none"> ◦ All ◦ Specific ◦ Prefer Non-DFS ◦ Prefer DFS • For 6 GHz: <ul style="list-style-type: none"> ◦ All ◦ Specific 		
Mode	All Enterprise Wi-Fi AP devices are either 802.11ax, 802.11ac Wave 1, or 802.11ac Wave 2 supported. There are few legacy clients which might not work as expected, hence this parameter can be tuned to backward compatibility based on wireless clients.	<ul style="list-style-type: none"> • 2.4 GHz: b/g/n/ax • 5 GHz: a/n/ac/ ax 	All mode
Short Guard Interval	Standard 802.11 parameter to increase the throughput of Enterprise Wi-Fi AP device.	-	Enabled
Off Channel Scan (OCS)			
Enable	Provision to enable OCS on a device to capture neighbor clients and APs.	-	-
Dwell-time	Configure the time period to spend scanning of Wi-Fi devices on a channel.	50-300	50ms
Auto-RF (Dynamic-power)			
Dynamic Power	Provision to enable dynamic power management.	-	-
Mode	Select the required dynamic power modes. Two modes are supported: <ul style="list-style-type: none"> 1. By-channel 2. By-band 	-	By-channel
Minimum Transmit Power	The minimum transmit power that the AP can assign to radio when adjusting automatic cell sizes	5-15 dBm	8 dBm
Minimum Neighbour Threshold	The minimum number of neighbors to consider for power reduction by automatic cell logic.	1-10	2
Cellsize Overlap Threshold	Cell overlap will be allowed when the AP is determining automatic cell sizes.	0-100%	50%

Parameter	Description	Range	Default
Auto-RF (Dynamic Channel)			
acceptance-per-threshold	Provision to configure acceptance Packet Error Rate (PER) threshold.	-	-
channel-hold-time	Channel hold time specifies how much time AP needs to hold the channel.	0-1800	-
channel-load-weightage	Provision to configure the channel load parameter weightage used in ACS algorithm.	-	-
congestion-channel-switch	Provision to enable/disable congestion based channel switch.	-	Enabled
congestion-threshold	Provision to configure congestion threshold.	-	-
efficiency-weightage	Provision to configure the efficiency parameter weightage used in ACS algorithm.	-	-
interval	Configure periodic ACS interval in minutes; Set '0' to disable.	-	-
per-channel-switch samples	Provision to enable/disable PER based channel switch.	-	Enabled
samples	Configure the minimum number of samples required to run the channel selection.	-	-
allowed-wlan-modes	<ul style="list-style-type: none"> • access : Only access WLANs are allowed • mesh : Only mesh WLANs are allowed • default : Both mesh and access types of WLANs are allowed 	-	default

To configure the above parameters, navigate to the **Configure > Radio** tab and select **Radio 1 (2.4GHz)** or **Radio 2 (5GHz)** tab and provide the details as given below:

1. Select the **Enable** check box to enable the operations of this radio.
2. Select the primary operating channel from the **Channel** drop-down list.
3. Select the operating width (20 MHz, 40 MHz, 80 MHz, or 160 MHz) of the channel from the Channel Width drop-down list for 5 GHz only. Enterprise Wi-Fi AP does not support 40 MHz, 80 MHz, and 160 MHz in 2.4 GHz.
4. Select radio transmits power from the **Transmit Power** drop-down list.
5. Enter the beacon interval in the **Beacon Interval** textbox.
6. Select the preferred **Candidate Channels** from the drop-down list.
7. Select **Mode** details from the drop-down list.

8. Enable **Short Guard Interval** check box.
9. Click **Save**.

To configure **Off Channel Scan**:

1. Select **Enable** check box to enable the operations of this radio.
2. Enter **Dwell-Time** in milliseconds in the text box.
3. Click **Save**.

To configure **Auto-RF (Dynamic-power)**:

1. Select **Dynamic Power** check box to enable the operations of this radio.
2. Select the required dynamic power **Mode** as By-channel or By-hand.
3. Enter the **Minimum Transmit Power** in the text box.
4. Enter **Minimum Neighbour Threshold** parameter in the text box.
5. Click **Save**.

To configure **Auto-RF (Dynamic Channel)**:

The following figure illustrates how to to configure **Auto-RF (Dynamic-channel)** using the CLI:

```
XV3-8-EC7708(config-radio-1)# auto-rf dynamic-channel
acceptance-per-threshold: Configure Acceptance Packet Error Rate (PER) threshold
channel-hold-time : channel hold time specifies how much time AP needs to hold the
channel <0-1800> mins,0 to disable hold
channel-load-weightage: Configure the channel load parameter weightage use in acs
algorithm
congestion-channel-switch: Enable / Disable Congestion based channel switch, enabled
by default
congestion-threshold: Configure Congestion threshold
efficiency-weightage: Configure the efficiency parameter weightage use in acs
algorithm
interval : Configure periodic ACS interval in minutes; Set '0' to disable
per-channel-switch : Enable / Disable PER based channel switch, enabled by default
samples : Configure the minimum number of samples required to run the channel
selection
```

Figure 14: Radio parameters in the Basic page

Basic Enhanced Roaming

Radio

Enable Enable operation of this radio

Band 2.4GHz Configure the supported bands

Channel Automatic Primary operating channel

Channel Width 20MHz Operating width of the channel

Transmit Power Auto Radio transmit power in dBm (4 to 30, Subject to regulatory limit)

Beacon Interval 100 Beacon interval in mSec (100 to 3500 in increments of 100)

Minimum Unicast rate default Configure the minimum unicast management rate (Mbps)

Multicast data rate default Data-rate to use for transmission of multicast/broadcast packets

Airtime Fairness Enable Airtime Fairness

Candidate Channels All

Mode default Allow 802.11 b/g/n clients to connect

Short Guard Interval Enable short guard interval

Off Channel Scan

Enable Enable OCS

Dwell-time 50 Configure Off-Channel-Scan dwelltime in milliseconds (50-300)

Auto RF

Dynamic Power Enable dynamic power management

Mode By-channel By-band Set dynamic power mode by-channel/by-band

Minimum Transmit Power 8 Minimum transmit power that the AP can assign to a radio when adjusting automatic cell sizes. (5-15) dBm

Minimum Neighbour Threshold 2 The Minimum number of neighbors to consider for power reduction by auto cell logic. (1-10)

Cellsize Overlap Threshold 50% Cell overlap that will be allowed when the AP is determining automatic cell sizes (0-100) %

Save Cancel

Basic

Status

Enabled Disabled Enable/Disable operation of this radio

Channel

Auto Only 'Auto' value is allowed. Configure static channel under the 'Advanced Settings' section available on the Access Point level configuration page [Learn more](#)

Candidates Channel

All

Candidate channels is a list of channels on which AP can operate. List of channels depend on the band and country.

Channel Width

20 Operating width of the channel

Transmit Power

Auto Radio transmit power in dBm (4 to 30; subject to regulatory limit)

Beacon Interval

100 Beacon interval in ms (50 to 3500) ⓘ

Minimum Unicast Rate

1 Configure the minimum unicast management rate (Mbps)

Multicast Data Rate

Highest Basic Data-rate to use for transmission of multicast/broadcast packets

Mode

Default Allow 802.11 b/g/n clients to connect

Airtime Fairness Enable Airtime Fairness to improve performance of 11n and 11ac clients by throttling legacy clients

Short Guard Interval Enable Short Guard interval to increase device throughput

Channel Scan

Off Channel Scan Continuous Background Scan None Enable/Disable operation of this radio

OCS periodically goes away from current operating channel (home channel) to other channels and collects data about neighboring clients, AP and RF characteristics.

Dwell time

50 Configure Off Channel Scan dwell time in milliseconds (50-300)

Auto-RF

Auto-RF Dynamic Power option adjusts the radio transmit power based on the neighboring Cambium APs transmit power. Auto-RF Dynamic Channel changes the radio channel based on current operating channel RF conditions like channel utilization, interference, packet error rate and etc.

Mode Selection

Dynamic Channel

Enable Enable Auto-RF to adjust dynamic channel selection based on RF conditions

Packet Error Rate Enable channel change using unsuccessful packet transmissions by the AP

Channel Utilization Enable channel change using the channel efficiency

Noise Enable channel change with higher noise

Samples

3 Configure the minimum number of samples required to run the channel selection (1-20)

Channel Hold Time

120

Channel hold time specifies how much time AP needs to hold the channel <0-1800> mins,0 to disable hold

Efficiency Weightage

60 Configure the efficiency parameter weightage use in ACS algorithm in %(0-100)

SNR Weightage

60 Configure the SNR parameter weightage use in ACS algorithm in %(0-100)

Channel Load Weightage

40 Configure the channel load parameter weightage use in ACS algorithm in %(0-100)

Interval

0 Configure periodic ACS interval in minutes; Set '0' to disable. (0-86400)

Deprecated (Version 3.11.4 and 4.0)

Channel Selection Mode

Interference Channel selection done based on interference

Channel Hold Time

120 Configure channel hold time in minutes (5-1800)

Channel Utilization Threshold

25 Configure channel utilization threshold in %(20-40)

Software Define Radio (SDR) capabilities

Off Channel Scan (OCS)

The following figure illustrates how to to configure **Off Channel Scan** using the CLI:

```
XV3-8-EC7708(config)# wireless radio 2
XV3-8-EC7708(config-radio-2)# off-channel-scan
```

```
dwll-time : Configure Off-Channel-Scan dwelltime
interval : Configure Off-Channel-Scan interval
type : Configure active/passive Off-Channel-Scan
```

```
XV3-8-EC7708(config-radio-2)# off-channel-scan type
active : active off channel scan
passive : passive off channel scan
```

Below table lists the fields that are required for configuring **Off Channel Scan**:

Table 18: Configuring Off Channel Scan

Parameter	Description	Range	Default
dwll time	Provision to configure Off Channel Scan dwell time. Needs to change 100 or more than 100+ ms for supporting passive scan method.	50-300	50ms
interval	AP Off Channel Scan interval time.	-	6 sec
type	Provision to configure Off Channel Scan types. <ul style="list-style-type: none"> active 	-	active

Parameter	Description	Range	Default
	<p>AP Radio transmits a probe request and listens for a probe response from an AP.</p> <ul style="list-style-type: none"> passive <p>AP Radio listens on each channel for beacons sent periodically by neighbor APs.</p> <p>Users are advised to use passive as scan type.</p>		

Enhanced Roaming

Below table lists configurable fields that are displayed in the **Configuration > Radio > Enhanced Roaming** tab:

Table 19: Configure: Radio Enhanced Roaming parameters

Parameter	Description	Range	Default
Enhanced Roaming			
Enable	Provision to enable enhanced roaming on device.	-	Disabled
Roam SNR threshold	Enterprise Wi-Fi AP device triggers de-authentication of the wireless station when the wireless station is seen at configured SNR level or below.	1-100	15dB

To configure the above parameters, navigate to the **Configuration > Radio > Enhanced Roaming** tab and provide the details as given below:

1. Select the **Enable** check box to enable the operations of this radio.
2. Enter **Roam SNR threshold** parameter in the text box.
3. Click **Save**.

Figure 15: The Enhanced Roaming parameters

The screenshot shows the configuration interface for Enhanced Roaming. It has two tabs: 'Basic' and 'Enhanced Roaming', with 'Enhanced Roaming' being the active tab. The interface contains the following elements:

- An **Enable** checkbox, which is checked.
- An unchecked checkbox labeled *Enable active disconnection of clients with weak signal*.
- A text input field for **Roam SNR threshold** with the value **15** entered.
- A descriptive text next to the SNR threshold field: *SNR below which clients will be forced to roam (1-100 dB)*.
- Two buttons at the bottom: **Save** (in blue) and **Cancel** (in grey).

Enhanced Roaming

Please enable enhanced roaming only in networks with sufficient signal strength throughout the coverage area, otherwise clients could face connectivity issues

Enable Enable active disconnection of clients with weak signal

Roam SNR Threshold

SNR below which clients will be forced to roam (1-100 dB)

BSS Coloring

Multiple APs operate on a shared channel by mitigating co-channel interference. This is made possible by a spatial reuse technique known as BSS Coloring, which enables devices in one BSS to ignore frames from other BSSs on the same channel, which are typically some distance away.

Target Wake Time (TWT)

The Target Wake Time (TWT) feature, included in the IEEE 802.11ax amendment, provides a mechanism to schedule transmissions at a specific time or set of times for individual STAs to wake to exchange frames with AP. Using TWT, each STA negotiates awake periods with the AP to transmit and receive data packets and can go to doze mode to minimize energy consumption and reduce contention within the basic service set (BSS).

Note

By default, BSS coloring and TWT are enabled.

Receive sensitivity configuration

This feature enables users to configure the receiver sensitivity per radio. The configuration hooks are exposed from both CLI and XMS-Cloud. The cnMaestro does not expose any hooks for configuring receiver configuration. The receiver configuration is the signal power required at the receiver to achieve the targeted or configured bit rate. Every RF receiver comes up with some default receiver sensitivity which may or may not be sufficient for achieving required RF performance in terms of meeting bit rate, hence reconfiguration of receiver sensitivity is suggested.

Multicast-snooping and Multicast-to-Unicast conversion

Multicast-to-Unicast conversion heavily depends on multicast (IGMP) snooping. With IGMP snooping enabled, the device monitors IGMP traffic on the network and forwards multicast traffic to only the downstream interfaces that are connected to interested receivers. The device conserves bandwidth by sending multicast traffic only to clients connected to devices that receive the traffic (instead of flooding the traffic to all the downstream clients in a VLAN).

The functionality to preserve both multicast and unicast MAC addresses during multicast enhancement implementation for packets in APs is introduced. The AP supports Directed Multicast Services (DMS) and Multicast Enhancement (ME). ME is a feature provided in APs that allows multicast frames to be sent as unicast frames to each member of the mentioned multicast group to improve the QoS of the transmission between the STA and the AP. The multicast frame is received at the host WLAN driver as an 802.3 (Ethernet) frame. This frame header contains the destination and source address, which are the multicast group address and client address, respectively. Iteratively, the Ethernet header is replaced with the unicast addresses of the clients present in the multicast group and sent out to the “air”. During this process, the multicast group address is completely lost from the frame.

CLI Configuration:

```
XV3-8-EC7708(config)# service show mcastsnoop br0 mdbtbl

-----Bridge Snooping Hash Table -- IPv4-----
NUM  GROUP                                FDB                                PORT  AGE
IPv4 Router Ports:      None

-----Bridge Snooping Hash Table -- IPv6-----
NUM  GROUP                                FDB                                PORT  AGE
IPv6 Router Ports:      None
XV3-8-EC7708(config)# service show mcastsnoop br0 acltbl

Chapter 6: Configuring the Wireless LAN

This chapter describes the following topics:

- [Overview](#)
- [Configuring the WLAN parameters](#)
- [Link Aggregation Control Protocol \(LACP\)](#)
- [Radius attributes](#)
- [enhanced PSK \(ePSK\)](#)
- [RADIUS-based ePSK](#)

Overview

Enterprise Wi-Fi AP devices support up to 16 unique WLANs. Each of these WLANs can be configured as per the customer requirement and type of wireless station.

Configuring the WLAN parameters

Configurable parameters under the WLAN profile are listed below:

- [Basic](#)
- [Radius Server](#)
- [Guest Access](#)
 - [Internal Access Point](#)
 - [External Hotspot](#)
 - [cnMaestro](#)
 - [XMS/EasyPass](#)
- [Usage Limits](#)
- [Scheduled Access](#)
- [Access](#)
- [Passpoint](#)

Basic

[Table 1](#) lists configurable fields that are displayed in the **Configuration > WLAN > Basic** tab.

Table 20: Basic parameters

Parameters	Description	Range	Default
WLAN > Basic			
Enable	Enables a WLAN profile. Once enabled, a Beacon is broadcasted with the SSID and the corresponding parameters configured in a WLAN profile.	-	-
Mesh	<p>This parameter is required when a WDS connection is established with Enterprise Wi-Fi devices. This parameter supports the following options:</p> <ul style="list-style-type: none"> • Base A WLAN profile configured with a mesh-base will operate as a normal AP. Its radio will beacon on startup so its SSID can be seen by radios configured as mesh-clients. • Client A WLAN profile configured with mesh-client will scan all available channels on startup, looking for a mesh-based AP to connect. • Recovery A WLAN profile configured as mesh-recovery will broadcast a pre-configured SSID upon detection of mesh link failure after a successful connection. This needs to be exclusively configured on a mesh-base device. Meshclient will auto scan for mesh-recovery SSID upon failure of mesh link. • Off Mesh support disabled on WLAN profile. 	-	OFF (Access Profile Mode)
VLAN	Segregates wireless station traffic from AP traffic in the network. Wireless stations obtain an IP address from the subnet configured in the VLAN field of the WLAN profile.	1-4094	1
Radios	<p>Each SSID can be configured to be transmitted as per the deployment requirement. For a regular access profile, options are available to configure transmit mode of SSID:</p> <ul style="list-style-type: none"> • 2.4 GHz • 5 GHz • 6 GHz 	-	all
SSID	Unique network name that wireless stations scan and associate.	-	-

Parameters	Description	Range	Default
Security	<p>Determines key values that are encrypted based on the selected algorithm. Following security methods are supported:</p> <ul style="list-style-type: none"> Open This method is preferred when Layer 2 authentication is built into the network. With this configured on an Enterprise Wi-Fi AP device, any wireless station will be able to connect. OWE This method ensures the communication between each pair of endpoints is protected from other endpoints. Osen This method is extensively used when Passpoint 2.0 is enabled on Enterprise Wi-Fi AP devices. If Passpoint 2.0 is disabled, this security plays no role in wireless station association. WPA2-Pre-Shared Keys This mode is supported with AES and TKIP encryption. WPA-TKIP can be enabled from the CLI with the “allow-tkip” CLI option. WPA2 Enterprise This security type uses 802.1x authentication to associate wireless stations. This is a centralized system of authentication methods. WPA2/WPA3 Pre-shared Keys WPA3 comes with a transition mode where WPA2-only capable clients can connect to SSID. WPA2-only capable clients connect using the older PSK method while WPA3 capable clients connect using a more secure Simultaneous Authentication of Equals (SAE) method. WPA3 Pre-shared Keys WPA3 replaces the Pre-Shared Key (PSK) exchange with SAE of Equals, which is more secure and provides forward-secrecy as well as resistance to offline dictionary attack. WPA3 Enterprise 	-	Open

Parameters	Description	Range	Default
	<p>WPA3 also introduces Enterprise AES CCMP encryption. This level of security provides consistent cryptography and eliminates the mixing and matching of security protocols that are defined in the 802.11 standards.</p> <ul style="list-style-type: none"> • WPA3 Enterprise CNSA <p>WPA3 also introduces a 192-bit cryptographic security suite. This level of security provides consistent cryptography and eliminates the mixing and matching of security protocols that are defined in the 802.11 standards. This security suite is aligned with the recommendations from the Commercial National Security Algorithm (CNSA) Suite and is commonly used in high-security Wi-Fi networks in government, defense, Finance, and industrial verticals.</p> <ul style="list-style-type: none"> • User Pre-shared keys <p>The U-PSK (User-PSK) Authentication settings are only used in conjunction with XMS Cloud's EasyPass Onboarding Portals. The Cloud automatically configures this setting for an WLAN when you create an Onboarding portal and you assign that WLAN to the portal. Thus, you should not normally change this setting manually. Note that the User- PSK settings are only available on the WLAN profile.</p>		
Passphrase	The string that is a key value to generate keys based on the security method configured.	-	12345678
VLAN Pooling	<p>This parameter is required when a user requires to distribute clients across multiple subnets. Different modes of VLAN pooling is supported by Enterprise Wi-Fi AP devices, based on infrastructure available at the deployment site. Modes supported are as follows:</p> <ul style="list-style-type: none"> • Disabled <p>This feature is disabled for this WLAN.</p> <ul style="list-style-type: none"> • Radius Based <p>The user is expected to configure WPA2 Enterprise for this mode to support. During the association phase, AP obtains pool name from RADIUS transaction and based on the present distribution of wireless station across VLANs, AP selects appropriate VLAN and wireless station requests an IP address from the VLAN selected by Enterprise Wi-Fi AP device.</p> <ul style="list-style-type: none"> • Static 	-	Disabled

Parameters	Description	Range	Default
	For this mode to support, the user requires to configure VLAN Pool details available under Configure > Network > VLAN pool . During the association phase, AP obtains pool, and based on the present distribution of wireless station across VLANs, AP selects appropriate VLAN and wireless station requests an IPv4 address from the VLAN selected by the Enterprise Wi-Fi AP device.		
Max Clients	This specifies the maximum number of wireless stations that can be associated with a WLAN profile. This varies based on the Enterprise Wi-Fi AP device model number. Refer to Table 21 for more details.	1-512 (Refer Table 21)	256
Client Isolation	<p>This feature needs to be enabled when there is a need for restriction of wireless station to station communication across the network or on an AP. Four options are available to configure based on requirement:</p> <ul style="list-style-type: none"> • Disable This option when selected disables the client isolation feature. i.e. any wireless station can communicate to other wireless stations. • Local This options when selected enable the client isolation feature. This option prevents wireless station communications connected to the same AP. • Network Wide This options when selected enable the client isolation feature. It prevents wireless stations communications connected to different AP deployed in the same L2 network. Note: <ul style="list-style-type: none"> • Network-wide mode is not supported when Redundancy Gateway protocol is used on deployment. • In the Redundancy Gateway case, Network-wide static can be used to provide a list of Gateway MAC addresses. • Network Wide Static 		

Parameters	Description	Range	Default
	<p>This option when configured enables client isolation feature across the network. Wireless stations can communicate only to statically added MAC list. Communication to rest other MAC addresses are blocked.</p> <p>Note: When Network Wide and Network Wide Static are selected, the user has the provision to add the whitelist MAC addresses to allow the communication. A maximum of 64 MAC addresses can be added.</p>		
cnMaestro Managed Roaming	Provision to enable centralized management of roaming for wireless clients through cnMaestro.	-	-
Hide SSID	This is the basic security mode of a Wi-Fi device. This parameter when enabled, will not broadcast SSID.	-	Disabled
Session Timeout	This field applies to all wireless clients connected to the SSID. When a wireless station connects, a session timer is triggered. Once session time expires, the wireless station must undergo either re-authentication or re-association based on the state of the wireless station. By default, it is enabled.	60-604800	28800
Inactivity Timeout	Inactivity timer triggers whenever there is no communication between Enterprise Wi-Fi AP device and wireless station associated to Enterprise Wi-Fi AP device. Once the timer reaches the configured Inactivity timeout value, APs send a de-authentication to that wireless station. By default, it is enabled.	60-28800	1800

Figure 16: Basic parameter

The screenshot shows the 'Basic' configuration tab for a WLAN. The parameters are as follows:

Parameter	Value	Description
Enable	<input checked="" type="checkbox"/>	
Mesh	Off	Mesh Base/Client/Recovery mode
VLAN	1	Default VLAN assigned to clients on this WLAN. (1-4094)
Radios	all	Define radio types (2.4GHz, 5GHz, 6GHz) on which this WLAN should be supported
SSID	1212	The SSID of this WLAN (upto 32 characters)
Security	WPA2 Pre-shared Keys	Set Authentication and encryption type
Passphrase	*****	WPA2 Pre-shared Security passphrase or key
VLAN Pooling	Disable	Configure VLAN pooling
Max Clients	256	Default maximum Client assigned to this WLAN. (1-512)
Client Isolation	Disable	When selected, it allows wireless clients connected to the same AP or different APs to communicate with each other in the same VLAN
cnMaestro Managed Roaming	<input type="checkbox"/>	Enable centralized management of roaming for wireless clients through cnMaestro
Hide SSID	<input type="checkbox"/>	Do not broadcast SSID in beacons
Session Timeout	28800	Session time in seconds (60 to 604800)
Inactivity Timeout	1800	Inactivity time in seconds (60 to 28800)
Drop Multicast Traffic	<input type="checkbox"/>	Drop the send/receive of multicast traffic

To configure the above parameters, navigate to the **Configure > WLAN > Basic** tab and provide the details as given below:

1. Select the **Enable** checkbox to enable a particular WLAN.
2. Enter the SSID name for this WLAN in the **SSID** textbox.
3. Enter the default VLAN assigned to the clients on this WLAN in the **VLAN** textbox.
4. Select **Security** type from the drop-down list.
5. Enter WPA2 pre-shared security passphrase or key in the **Passphrase** textbox.
6. Select the radio type (2.4 GHz, 5 GHz) on which the WLAN should be supported from the **Radios** drop-down list.
7. Select the required **VLAN Pooling** parameters from the drop-down list.
8. Select **Max Clients** parameter value from the drop-down list.
9. Select the required **Client Isolation** parameter from the drop-down list.
10. Enable **cnMaestro Managed Roaming** checkbox.
11. Enable **Hide SSID** checkbox.
12. Enter the session timeout value in the **Session Timeout** textbox.
13. Enter the inactivity timeout value in the **Inactivity timeout** textbox.
14. Click **Save**.

Table 21: WLAN (Max clients) parameters

Number of clients	2.4 GHz	5 GHz	6 GHz	Concurrent
XV3-8	512	1024*	NA	1536

* Two 5 GHz radios are available in Single Band Simultaneous (SBS) mode.

** Two 6 GHz radios are available in XE5-8 platform.

Maximum wireless client

At present, the WLAN profile provides an option to configure the maximum wireless clients association limit. This configuration limits the maximum number of clients per SSID per Radio. For example, if a user configures the maximum wireless client as 10, on a device capable of 2.4 GHz and 5 GHz radios, the total number of clients that can be associated is 10 across each Radio. This has been enhanced in Release 6.5 to set the maximum clients limit per SSID irrespective of the number of Radios to which SSID has been mapped.

Maximum clients per device

Most customers commonly use more than a single SSID. They prefer to set the maximum number of wireless clients connection per device, i.e. irrespective of the number of WLAN profiles and the number of radios, the maximum number of clients that can be associated is equivalent to the value configured for the parameter max-clients. This is a global configuration.

CLI configuration:

```
XV3-8-EC7708(config)# max-clients
0|<1-1536> '0' disables max client per device
```

Maximum clients per SSID

This option helps to limit the number of wireless clients connected to a WLAN profile (SSID) irrespective of the number of Radios. This configuration is supported at the WLAN level. This can be enabled as follows:

CLI configuration:

```
XV3-8-EC7708(config)# wireless wlan 1
XV3-8-EC7708(config-wlan-1)# enforce-max-clients-per-ssid
```

Maximum clients per SSID per Radio

This is the default configuration of the device. This configuration limits the maximum number of clients per SSID per radio. For example, if a user configures the maximum wireless client as 20, on a device capable of 2.4 GHz and 5 GHz Radios, the total number of clients that can be associated is 20 across each Radio. This configuration is supported at the WLAN level.

CLI configuration:

```
XV3-8-EC7708(config)# wireless wlan 1
XV3-8-EC7708(config-wlan-1)# max-associated-clients
<1-1536>
```

The default priority order can be:

1. Per device (Global limit)
2. Per SSID and (enforce at SSID level)
3. Per SSID Per Radio basis (present default option)

To keep backward compatibility with the existing deployments, the default option can be Per SSID Per Radio basis.

Opportunistic Wireless Encryption (OWE)

OWE is a Wi-Fi standard, which ensures that the communication between each pair of endpoints is protected from other endpoints. The OWE transition mode allows OWE-capable STAs to access the network in OWE authentication mode. The OWE transition mode is implemented as follows:

You need to create two WLANs on an AP.

For example,

1. WLAN-1:
open authentication
owe-transition-ssid: Provides WLAN-2 owe security SSID
2. WLAN-2:
owe authentication
owe-transition-ssid: Provides WLAN-1 open security SSID

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# owe-transition-ssid
owe-transition-ssid : Configure the matching open/owe transition ssid
```

Note

The OWE transition mode SSIDs does not apply to a 6 GHz radio.

Table 22: Advanced parameters

Parameters	Description	Range	Default																														
WLAN > Advanced																																	
UAPSD	<p>When enabled, Enterprise Wi-Fi AP devices support WMM Power Save / UAPSD. This is required where applications such as VOIP Calls, Live Video streaming are in use. This feature helps to prioritize traffic. Below is the default traffic priority followed by the Enterprise Wi-Fi AP device.</p> <table border="1"> <thead> <tr> <th>Priority</th> <th>802.1D Priority (= UP)</th> <th>802.1D Designation</th> <th>Access Category</th> <th>WMM Designation</th> </tr> </thead> <tbody> <tr> <td rowspan="7">lowest ↓ highest</td> <td>1</td> <td>BK</td> <td rowspan="2">AC_BK</td> <td rowspan="2">Background</td> </tr> <tr> <td>2</td> <td>-</td> </tr> <tr> <td>0</td> <td>BE</td> <td rowspan="2">AC_BE</td> <td rowspan="2">Best Effort</td> </tr> <tr> <td>3</td> <td>EE</td> </tr> <tr> <td>4</td> <td>CL</td> <td rowspan="2">AC_VI</td> <td rowspan="2">Video</td> </tr> <tr> <td>5</td> <td>VI</td> </tr> <tr> <td>6</td> <td>VO</td> <td rowspan="2">AC_VO</td> <td rowspan="2">Voice</td> </tr> <tr> <td>7</td> <td>NC</td> </tr> </tbody> </table>	Priority	802.1D Priority (= UP)	802.1D Designation	Access Category	WMM Designation	lowest ↓ highest	1	BK	AC_BK	Background	2	-	0	BE	AC_BE	Best Effort	3	EE	4	CL	AC_VI	Video	5	VI	6	VO	AC_VO	Voice	7	NC	-	Disabled

	6	VO	AC_VO	Voice																													
7	NC																																
QBSS	When enabled, appends QBSS IE in Management frames. This IE provides information on channel usage by AP, so that smart wireless stations can decide better AP for connectivity. Station count, Channel utilization, and Available admission capacity are the information available in this IE.	-	Disabled																														
DTIM interval	This parameter plays a key role when power save supported mobile stations are part of the infrastructure. This field when enabled controls the transmission of Broadcast and Multicast frames.	1-255	1																														
Monitored Host																																	
Host	This feature is required where there is an interrupted backbone network. Enterprise Wi-Fi AP device monitors the reachability of hostname/IP configured in this parameter and modifies the state of WLAN.	-	Disabled																														
Interval	The frequency of monitoring the network health based on the status of the keep-alive mechanism w.r.t configured monitored host.	60-3600 sec	300																														
Attempts	The number of packets in the keep-alive mechanism to determine the status.	1-20	1																														
DNS Logging Host	By enabling this feature, the Administrator can monitor the websites accessed by wireless stations connected to WLAN profile.	-	Disabled																														

Parameters	Description	Range	Default
Connection Logging Host	When enabled provides information of all IP connections accessed by a wireless station that is associated with WLAN and logs the connection data seamlessly onto an external syslog server.	–	Disabled
Band Steering	This feature when enabled steers wireless stations to connect to 5GHz. There are three modes supported by Enterprise Wi-Fi devices. The mode can be selected based on either deployment or wireless station type. Below is the order of modes, which forces the wireless station to connect to the 5 GHz band. <ul style="list-style-type: none"> • Low • Normal • Aggressive 	–	Disabled
Proxy ARP	Provision to avoid ARP flood in a wireless network. When enabled, AP responds to ARP requests for the wireless stations connected to that AP. This is for IPv4 infrastructure.	–	Enabled
Insert DHCP Option 82	When enabled, DHCP packets generated from wireless stations that are associated with APs are appended with Option 82 parameters. Option 82 provides a provision to append Circuit ID and Remote ID. Following parameters can be selected in both Circuit ID and Remote ID: <ul style="list-style-type: none"> • Hostname • AP MAC • BSSID • SSID • VLAN ID • SITEID • Custom • All <div style="border: 1px solid black; background-color: #e1f5fe; padding: 5px; margin-top: 10px;">  <p>Note In case DHCP Option 82 is configured at the device-, WLAN profile-, and L3 interface-levels, the following priority order is considered:</p> <ol style="list-style-type: none"> 1. Device-level configuration 2. WLAN profile-level configuration 3. L3 interface-level configuration </div>	–	Disabled

Parameters	Description	Range	Default
Tunnel Mode	This option is enabled when user traffic is tunneled to the DMZ network either using L2TP or L2GRE.	–	Disabled
Fast-Roaming Protocol	<p>One of the important aspects to support voice applications on a Wi-Fi network (apart from QoS) is how quickly a client can move its connection from one AP to another. This should be less than 150 ms to avoid any call drop. This is easily achievable when the WPA2-PSK security mechanism is in use. However, in enterprise environments, there is a need for more robust security (the one provided by WPA2-Enterprise). With WPA2-Enterprise, the client exchanges multiple frames with the AAA server, and hence depending on the location of the AAA server the roaming time will be above 700 ms.</p> <p>Select any one of the following:</p> <ul style="list-style-type: none"> OKC <p>This roaming method is a Cambium Networks proprietary solution to share the client authentication information with other Cambium Networks APs on the same network by sending encrypted information on wire on SSID VLAN. This information sharing does not require cnMaestro so even in cases where AP is not connected to cloud, the roaming will be seamless.</p> 802.11r <p>Fast transition (FT) is an IEEE standard to permit continuous connectivity aboard wireless devices in motion, with fast and secure client transitions from one Basic Service Set (abbreviated BSS, and also known as a base station or more colloquially, an access point) to another, performed in a nearly seamless manner. The terms handoff and roaming are often used, although 802.11 transition is not a true handoff/roaming process in the cellular sense, where the process is coordinated by the base station and is generally uninterrupted.</p> 	–	Disabled
RRM (802.11k)	<p>AP sends the SSID name of the neighbor APs (SSID configured on multiple APs) to 802.11k clients.</p> <p>The following parameter must be enabled:</p> <ul style="list-style-type: none"> Enable RRM 	–	Disabled
802.11v	Provision to enable 802.11v BSS Transition Management.	–	Disabled
PMF (802.11w)	802.11w also termed as Protected Management Frames (PMF) Service, defines encryption for management frames. Unencrypted management frames make wireless connection vulnerable to DoS attacks as well as they cannot protect important information exchanged using management frames from eavesdroppers.	–	Optional

Parameters	Description	Range	Default
SA Query Retry Time	The legitimate 802.11w client must respond with a Security Association (SA) Query Response frame within a pre-defined amount of time (milliseconds) called the SA Query Retry time.	100-500	100ms
Association Comeback Time	This value is included in the Association Response as an Association Comeback Time information element. AP will deny association for the configured interval.	1-20	1 Sec

To configure the above parameters, navigate to the **Configure > WLAN > Basic** tab and provide the details as given below:

1. Select the **UAPSD** checkbox to enable UAPSD.
2. Select the **QBSS** checkbox to enable QBSS.
3. Enter the value in the **DTIM interval** textbox to configure the DTIM interval.
4. Enter IP address or Hostname in **Host** textbox.
5. Enter **Interval time** duration in the textbox.
6. Select number of attempts to check the reachability of the monitored host in the **Attempts** drop-down list.
7. Enter the FQDN or IP address of the server where all the client DNS requests will be logged in the **DNS Logging Host** server along with a customized port number in the textbox. If the port number is not entered, AP will take the default value as 514.
8. Enter the FQDN or IP address of the server where all wireless client connectivity events/logs will be displayed in the configured **Connection Logging Host** server along with a customized port number in the textbox. If the port number is not entered, AP will take the default value as 514.
9. Select **Band Steering** parameter for 5GHz band from the drop-down list.
10. Enable **Proxy ARP** checkbox to avoid ARP flood in a wireless network.
11. Enable **Insert DHCP Option 82** checkbox.
12. Select **Option 82 Circuit ID** to enable DHCP Option-82 from the drop-down list.
13. Select **Option 82 Remote ID** to choose the MAC address of the AP from the drop-down list.
14. Select **Tunnel Mode** checkbox to enable tunneling of WLAN traffic over the configured tunnel.
15. Enable the required OKC or 802.11r configure roaming protocol in the **Fast-Roaming Protocol** checkbox.
16. Enable **RRM (802.11k)** checkbox.
17. Enable **802.11v** checkbox.
18. Select **PMF (802.11w)** parameter from the drop-down list.
 - a. Enter **SQ Query Retry Time** in the textbox.
 - b. Enter **Association Comeback Time** in the textbox.
19. Click **Save**.

Figure 17: Advanced parameter

The screenshot shows the 'Advanced' configuration page for a wireless LAN interface. The settings are as follows:

- UAPSD**: Enable UAPSD
- QBSS**: Enable QBSS load element
- DTIM interval**: Number of beacons (1-255)
- Monitored Host** (grouped in a box):
 - Host**: IP Address or Hostname that should be reachable for this WLAN to be active
 - Interval**: Duration in seconds (60-3600)
 - Attempts**: Number of attempts to check the reachability of monitored host (1-20)
- DNS Logging Host**: **Port**: Syslog server where all client DNS requests will be logged
- Connection Logging Host**: **Port**: Syslog server where all client connection requests will be logged
- Band Steering**: Steer dual-band capable clients towards 5GHz radio
- Proxy ARP**: Respond to ARP requests automatically on behalf of clients
- Proxy ND**: Respond to IPv6 ND requests automatically on behalf of clients
- Unicast DHCP**: Convert DHCP-OFFER and DHCP-ACK to unicast before forwarding to clients
- Insert DHCP Option 82**: Enable DHCP Option 82
- Option 82 Circuit ID**:
- Option 82 Remote ID**:
- Tunnel Mode**: Enable tunnelling of WLAN traffic over configured tunnel
- Fast-Roaming Protocol**: OKC 802.11r Configure roaming protocol
- RRM (802.11k)**: Enable Radio Resource Measurements (802.11k)
- 802.11v**: Enable 802.11v BSS Transition Management

At the bottom of the page, there are two buttons: **Save** and **Cancel**.

Band steering also supports client load balancing based on the below CLI configuration:

```
XV3-8-EC7708(config)# wireless wlan 1
XV3-8-EC7708(config-wlan-1)# band-steer-load-balancing
client-counts : client counts for band steer to consider clients load balancing
client-percentage : Client percentage for band steer to consider clients load balancing
```

WLAN VLAN allowed list

This is an optional CLI to configure the allowed VLAN list upfront. It is needed in multiple VLAN scenarios such as Dynamic VLAN, ePSK-based VLAN, and RADIUS VLAN.

CLI configuration:

```
XV3-8-EC7708(config)# wireless wlan 1
XV3-8-EC7708(config-wlan-1)# vlans-allowed
{vlan_list} <e.g 1-10,15,100>
```

```
XV3-8-EC7708(config-wlan-1)# vlans-allowed 1-10
```

ICMPv6 Router advertisement (RA) unicast conversion

Convert ICMPv6 RA Multicast packets to Unicast for all stations. ICMPv6 RA unicast conversion is needed in multiple VLAN scenarios such as Dynamic VLAN, ePSK-based VLAN, and RADIUS-based VLANs.

This CLI configuration allows to configure the VLANs where ICMPv6 RA unicast conversion is needed.

CLI configuration:

```
XV3-8-EC7708(config)# wireless wlan 1
XV3-8-EC7708(config-wlan-1)# ipv6-router-advertisement-unicast
vlans : Configure vlans where IPV6 Router Advertisement unicast conversion needed
XV3-8-EC7708(config-wlan-1)# ipv6-router-advertisement-unicast vlans
{vlan_list} <e.g 1-10,15,100>
XV3-8-EC7708(config-wlan-1)# ipv6-router-advertisement-unicast vlans 1-10
```

802.11k/v

802.11k

Radio Resource Measurement (RRM) defines and exposes radio and network information to facilitate the management and maintenance of a wireless network. 802.11k is intended to improve the way traffic is distributed within the network.

The client can request a neighbor report from the AP using the `neighbor_report_req` management message. The client may request neighbors with **matching** SSID or request for all neighbors in the vicinity. The AP collects the neighbor information using proprietary methods and provides the list of neighbors to the client in the `neighbor_report_rsp` message.

802.11v

802.11v is deployed on the APs to govern the wireless networking transmission methods. It allows clients and APs to exchange information regarding the network topology, and RF environment. This facilitates the wireless devices to be RF-aware for participating in network-assisted power savings and network-assisted roaming methods.

The client may send solicited BSS Transition Management messages to AP before making roaming decisions. The idea is to identify the best APs to roam. The AP, after receiving the message from a client is expected to respond with the best APs in the vicinity to assist the client in roaming. The neighbor information is collected using proprietary methods.

Radius server

[Table 4](#) lists configurable fields that are displayed in the **Configuration > WLAN > Radius Server** page:

Table 23: Radius Server parameters

Parameters	Description	Range	Default
Authentication Server	Provision to configure RADIUS Authentication server details such as Hostname/IPv4, Shared Secret, Port Number and Realm. A maximum of three RADIUS servers can be configured.	-	Disabled
Accounting Server	Provision to configure Accounting server details such as Hostname/IPv4, Shared Secret, Port Number. A maximum of three RADIUS servers can be configured.	-	Disabled
Timeout	This field indicates wait time period for a response from the AAA server.	1-30	3
Attempts	Parameter to configure many attempts that a device should send AAA request to server if no response is received within the configured timeout period.	1-3	1
Accounting Mode	<p>This field is enabled based on customer requirements. The accounting packet is transmitted based on the mode selected.</p> <ul style="list-style-type: none"> • Start-Stop Accounting packets are transmitted by AP to the AAA server when a wireless station is connected and then disconnects. • Start-Interim-Stop Accounting packets are transmitted by AP to the AAA server when a wireless station connects and then at regular intervals of configured Interim Update Interval and then when it disconnects. • None The accounting mode will be disabled. 	-	Disabled
Accounting Packet	When enabled, Accounting-On is sent for every client when connected.	-	Disabled
Server Pool Mode	<p>Users can configure multiple Authorization and Accounting servers. Based on a number of wireless stations, the user can choose Failover mode.</p> <ol style="list-style-type: none"> 1. Failover AP selects the RADIUS server which is up and running based on the order of configuration. 	-	Failover
NAS Identifier	This is a configurable parameter and is appended in the RADIUS request packet.	-	Hostname/ System Name

Parameters	Description	Range	Default
Dynamic Authorization	This option is required, where there is CoA request from AAA/RADIUS server.	-	Disabled
Dynamic VLAN	When enabled, AP honors the VLAN information provided in the RADIUS transaction. Wireless station requests IP address from the same VLAN learned through RADIUS.	-	Enabled
Proxy through cnMaestro aka Proxy Through Controller	This option is enabled, whenever cnMaestro is required to act as proxy server to RADIUS authentication requests coming from Enterprise Wi-Fi AP devices that are connected to cnMaestro.	-	Disabled
Called Station ID	The following information can be communicated to the RADIUS server: <ul style="list-style-type: none"> • AP-MAC • AP-MAC: SITE-NAME • AP-MAC: SSID • AP-MAC: SSID-SITE-NAME • AP-NAME • AP-NAME: SITE-NAME • AP-NAME: SSID • SITE-NAME • SSID • CUSTOM 	-	AP-MAC: SSID

To configure the above parameters, navigate to the **Configure > WLAN** tab, select **Radius Server** tab and provide the details as given below:

1. Enter the RADIUS Authentication server details such as Hostname, Shared Secret, Port Number or Realm in the **Authentication Server 1** textbox.
2. Enter the time in seconds of each request attempt in the **Timeout** textbox.
3. Enter the number of attempts before a request is given up in the **Attempts** textbox.
4. Select the configuring **Accounting Mode** from the drop-down list.
5. Enable **Accounting Packet** checkbox.
6. Enable **Failover** in the Server Pool Mode checkbox.
7. Enter the **NAS Identifier** parameter in the textbox.
8. Enter the **Interim Update Interval** parameter value in the textbox.
9. Enable **Dynamic Authorization** checkbox to configure dynamic authorization for wireless clients.
10. Enable **Dynamic VLAN** checkbox.
11. Enable **Proxy through cnMaestro** checkbox.
12. Select **Called Station ID** from the drop-down list.
13. Click **Save**.

Figure 18: The Radius Server parameter page

The screenshot shows the 'Radius Server' configuration page. It includes the following fields and options:

- Authentication Servers:** Three rows for configuring Host, Secret, Port, and Realm.
- Accounting Servers:** Three rows for configuring Host, Secret, and Port.
- Timeout:** Input field for seconds of each request attempt (1-30).
- Attempts:** Input field for number of attempts before giving up (1-3).
- Accounting Mode:** Dropdown menu (currently 'None').
- Accounting Packet:** Enable Accounting-On messages.
- Sync Accounting Records:** Configure accounting records to be synced across neighboring AP's.
- Server Pool Mode:**
 - Load Balance (Load balance requests equally among configured servers)
 - Failover (Move down server list when earlier servers are unreachable)
- NAS Identifier:** Input field (currently 'AP-HOSTNAME').
- Interim Update Interval:** Input field (currently '1800').
- Dynamic Authorization:** Enable RADIUS dynamic authorization (COA, DM messages).
- Dynamic VLAN:** Enable RADIUS assigned VLANs.
- Proxy through cnMaestro:** Proxy RADIUS packets through cnMaestro (on-premises) instead of directly to the RADIUS server from the AP.
- Called Station ID:** Dropdown menu (currently 'AP-MAC.SSID').

Proxy Through Controller

cnMaestro On-Premises can act as a proxy server for a AAA request coming from Enterprise Wi-Fi 6 Access Points. In this scenario, cnMaestro acts as Network Access Server (NAS) for the AAA server.

The AP sends AAA packets to cnMaestro On-Premises, and cnMaestro forwards them to the AAA server. When the Proxy Through Controller feature is enabled, CoA is supported other than AAA requests.

CLI configuration:

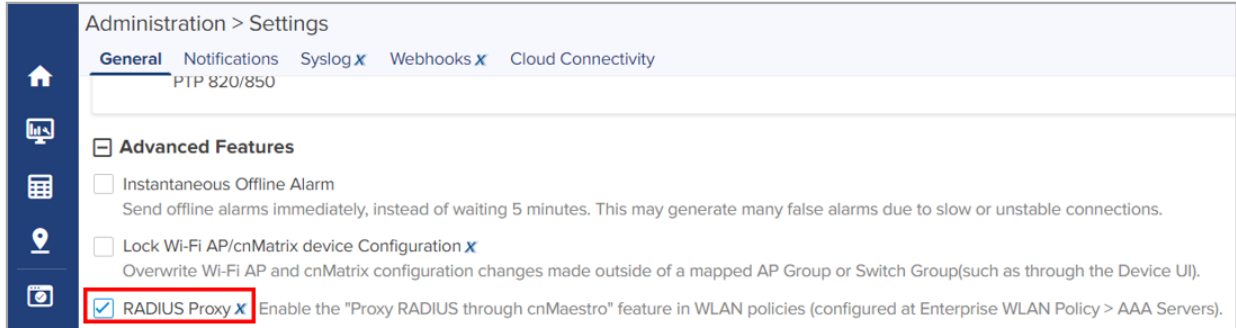

```
XV3-8-EC7708(config-wlan-1)# radius-server through-controller
```

Note: Applicable only with on-premises controller

For activating Proxy Through Controller feature in cnMaestro On-Premises:

1. Go to **Administration > Settings**.
2. Enable **RADIUS Proxy** checkbox as shown in below figure.

Figure 19: RADIUS proxy

EAP-FAST support

EAP-FAST authentication occurs in two phases. In the first phase, EAP-FAST employs the TLS handshake to provide an authenticated key exchange and to establish a protected tunnel. Once the tunnel is established the second phase begins with the peer and server engaging in further conversations to establish the required authentication and authorization policies.

Guest Access

Internal Access Point

Below table lists configurable fields that are displayed in the **Configuration > WLAN > Guest Access > Internal Access Point** page:

Table 24: Internal Access Point parameters

Parameters	Description	Range	Default
WLAN > Guest Access > Internal Access Point			
Enable	Enables the Guest Access feature.	-	Disabled
Access Policy	<p>There are four types of access types provided for the user:</p> <ol style="list-style-type: none"> 1. Clickthrough This mode allows the users to get access data without any authentication mechanism. User can access the internet as soon as he is connected and accepts Terms and Conditions 2. RADIUS 	-	Clickthrough >

Parameters	Description	Range	Default
	<p>This mode when selected, the user has to provide a username and password, which is then redirected to the RADIUS server for authentication. If successful, the user is provided with data access.</p> <p>3. Local Guest Account</p> <p>Users must configure username and password on the device, which has to be provided on the redirection page for successful authentication and data access.</p>		
Redirect Mode	<p>This option helps the user to configure the HTTP or HTTPS mode of redirection URL.</p> <p>1. HTTP</p> <p>AP sends an HTTP POSTURL to the associated client, which will be <a href="http://<Pre-defined-URL>">http://<Pre-defined-URL>.</p> <p>2. HTTPS</p> <p>AP sends HTTPS POSTURL to the success associated client, which will be <a href="https://<Pre-defined-URL>">https://<Pre-defined-URL>.</p>	-	HTTP
Redirect Hostname	Users can configure a friendly hostname, which is added to the DNS server and is resolvable to Enterprise Wi-Fi AP IP address. This parameter once configured will be replaced with an IP address in the redirection URL provided to wireless stations.	-	-
Title	Users can configure a Title to the splash page. Configured text in this parameter will be displayed on the redirection page. This text is usually Bold.	Up to 255 characters	Welcome To Cambium Powered Hotspot
Contents	Users can configure the contents of the Splash page using this field. Displays the text configured under the Title section of the redirection page.	Up to 255 characters	Enter username and password to get Web Access
Terms	Splash page displays the text configured when the user accepts the Terms and Agreement.	Up to 255 characters	-
Logo	Displays the logo image updated in URL <a href="http(s)://<ipaddress>/logo.png">http(s)://<ipaddress>/logo.png . Either PNG or JPEG format of the logo is supported.	-	-

Parameters	Description	Range	Default
Background Image	Displays the background image updated in URL http (s)://<ipaddress>/backgroundimage.png. Either PNG or JPEG format of the logo is supported.	-	-
Success Action	<p>Provision to configure redirection URL after successful login to captive portal services. Users can configure three modes of redirection URL:</p> <ol style="list-style-type: none"> 1. Internal Logout Page After successful login, the wireless client is redirected to the logout page hosted on AP. 2. Redirect user to External URL Here users will be redirected to the URL which is configured on the device in Redirection URL configurable parameter. 3. Redirect user to Original URL Here users will be redirected to the URL that is accessed by the user before successful captive portal authentication. 	-	Internal Logout page
Redirect user to External URL	<p>Provision to configure re-direction URL after successful login and additional information of AP and wireless station information can be appended in the URL.</p> <ul style="list-style-type: none"> • Prefix Query Strings in Redirect URL This option is selected by default. The following information is appended in the redirection URL: <ul style="list-style-type: none"> ◦ SSID ◦ AP MAC ◦ NAS ID ◦ AP IP ◦ Client MAC ◦ Redirection URL ◦ Users can provide either HTTP or HTTPS URL 	-	-
Redirection user to Original URL	Users will be redirected to the URL that is accessed by the user before successful captive portal authentication. There are additional parameter Prefix Query Strings in Redirection URL that is enabled by default and details given below:	-	-

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> Prefix Query Strings in Redirect URL <p>This option is selected by default. The following information is appended in the redirection URL:</p> <ul style="list-style-type: none"> SSID AP MAC NAS ID 		
Success message	Provision to configure the text to display upon successful Guest Access authentication. This is applicable only when Success Action mode is Internal Logout Page.	-	-
Redirect	<ul style="list-style-type: none"> If enabled, only HTTP URLs will be redirected to the Guest Access login page. If disabled, both HTTP and HTTPS URLs will be redirected to the Guest Access login page. 	-	Enabled
Redirect User Page	IPv4 address configured in this field is used as logout URL for Guest Access sessions.	-	1.1.1.1
Proxy Redirection Port	The proxy port can be configured with which proxy server is enabled. This allows URLs accessed with proxy port to be redirected to the login page.	1 - 65535	-
Session Timeout	This is the duration of time, the client will be allowed to access the internet if quota persists, after which AP sends de-authentication. The wireless station has to undergo Guest Access authentication after session timeout.	60 - 2592000	28800
Inactivity Timeout	Provision to configure timeout period to disconnect wireless stations that are associated but have no data traffic. AP starts a timer when there is no data received from a wireless station and disconnects when the timer reaches zero.	60 - 2592000	1800
MAC Authentication Fallback	It is a mechanism in which wireless stations will be redirected to the Guest Access login page after any supported type of MAC address authentication fails.	-	Disabled
Whitelist	Provision to configure either IPv4 or URLs to bypass traffic, therefor user can access those IPs or URLs without Guest Access authentication.	-	-

To configure the above parameters, navigate to the **Configure > WLAN > Guest Access** tab and provide the details as given below:

1. Select **Enable** checkbox to enable the Guest Access feature.
2. Enable **Internal Access Point** checkbox.

3. Enable the required access types from the **Access Policy** checkbox.
4. Enable HTTP or HTTPS from the **Redirect Mode** checkbox.
5. Enter **Redirect Hostname** in the textbox.
6. Enter the title to appear on the splash page in the **Title** textbox.
7. Enter the content to appear on the splash page in the **Contents** textbox.
8. Enter the terms and conditions to appear in the splash page in the **Terms** textbox.
9. Enter the logo to be displayed in the **Logo** textbox.
10. Select the **Background Image** to be displayed on the splash page in the textbox.
11. Enable configured modes of redirection URL in **Success Action** checkbox.
12. Enter **Success message** to appear in the textbox.
13. Enable **Redirect** checkbox for HTTP packets.
14. Enter configuring IP address in the **Redirect User Page** textbox.
15. Enter Port number in **the Proxy Redirection Port** textbox.
16. Enter the session timeout in seconds in the **Session Timeout** textbox.
17. Enter the inactivity timeout in seconds in the **Inactivity Timeout** textbox.
18. Enable **MAC Authentication Fallback** checkbox if guest-access is used only as a fallback for clients failing MAC-authentication.
19. Click **Save**.

To configure Whitelist parameter:

1. Enter the IP address or the domain name of the permitted domain in the **IP Address** or **Domain Name** textbox.
2. Click **Save**.

Figure 20: The Internal Access Point parameter

Basic	Radius Server	Guest Access	Usage Limits	Scheduled Access	Access	Passpoint

External Hotspot

Below table lists the configurable fields that are displayed in the **Configuration > WLAN > Guest Access > External Hotspot** tab:

Table 25: External Hotspot parameters

Parameters	Description	Range	Default
WLAN > Guest Access > External Hotspot			
Access Policy	<p>There are four types of access types provided for the end user:</p> <ol style="list-style-type: none"> Clickthrough This mode allows users to get access data without any authentication mechanism. The user can access the internet as soon as he is connected and accepts the Terms and Conditions. RADIUS The user has to provide a username and password, which is then redirected to a RADIUS server for authentication. If successful, the user is provided with data access. Local Guest Account The user has to configure username and password on the device, which has to be provided on the redirection page for successful authentication and data access. 	–	Clickthrough
Redirect Mode	<p>Provision to configure the HTTP or HTTPS mode of redirection URL.</p> <ol style="list-style-type: none"> HTTP AP sends an HTTP POSTURL to the associated client, which will be <a href="http://<Pre-defined-URL>">http://<Pre-defined-URL>. HTTPS AP sends an HTTPS POSTURL to the associated client, which will be <a href="https://<Pre-defined-URL>">https://<Pre-defined-URL>. 	–	HTTP

Parameters	Description	Range	Default
Redirect Hostname	Users can configure a friendly hostname, which is added to the DNS server and is resolvable to Enterprise Wi-Fi AP IP address. This parameter once configured will be replaced with an IP address in the redirection URL provided to wireless stations.	-	-
External Page URL	Users can configure a landing/login page that is posted to wireless stations that are not Guest Access authenticated.	-	-
External Portal Post Through cnMaestro	This is required when HTTPS is only supported by an external guest access portal. This option when enabled minimizes certification. The certificate is required to install only in cnMaestro On-Premises.	-	Disabled
External Portal Type	Enterprise Wi-Fi AP products are supported by standard mode configuration. <ul style="list-style-type: none"> • Standard This mode is selected, for all third-party vendors whose Guest Access services are certified and integrated with Enterprise Wi-Fi AP products. 	-	Standard
Success Action	Provision to configure redirection URL after successful login to captive portal services. User can configure three modes of redirection URL: <ol style="list-style-type: none"> 1. Internal Logout Page After successful login, the wireless client is redirected to the logout page hosted on AP. 2. Redirect user to External URL Here users will be redirected to the URL which is configured on a device in Redirection URL configurable parameter. 3. Redirect user to Original URL Here users will be redirected to a URL that is accessed by the user before successful captive portal authentication. 	-	Internal Logout Page
Redirect user to External URL	Provision to configure re-direction URL after successful login and additional information of AP and wireless station information can be appended in the URL. <ul style="list-style-type: none"> • Prefix Query Strings in Redirect URL 	-	-

Parameters	Description	Range	Default
	<p>This option is selected by default. The following information is appended in the redirection URL:</p> <ul style="list-style-type: none"> ◦ SSID ◦ AP MAC ◦ NAS ID ◦ AP IP ◦ Client MAC <ul style="list-style-type: none"> • Redirection URL <p>Users can provide either HTTP or HTTPS URLs.</p>		
Redirection user to Original URL	<p>Users will be redirected to the URL that is accessed by the user before successful captive portal authentication. There are additional parameter Prefix Query Strings in Redirection URL that is enabled by default and details given below:</p> <ul style="list-style-type: none"> • Prefix Query Strings in Redirect URL <p>This option is selected by default. The following information is appended in the redirection URL:</p> <ul style="list-style-type: none"> ◦ SSID ◦ AP MAC ◦ NAS ID ◦ AP IP ◦ Client MAC 	–	–
Success message	<p>Provision to configure the text to display upon successful Guest Access authentication. This is applicable only when Success Action mode is Internal Logout Page.</p>	–	–
Redirection URL Query String	<p>The following information is appended in the redirection URL, if Prefix Query Strings in Redirect URL is enabled.</p> <ul style="list-style-type: none"> • Client IP • RSSI • AP Location 	–	Disabled
Redirect	<ul style="list-style-type: none"> • If enabled, only HTTP URLs will be redirected to the Guest Access login page. 	–	Enabled

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> If disabled, both HTTP and HTTPS URLs will be redirected to the Guest Access login page. 		
Redirect User Page	The IP address configured in this field is used as logout/disconnect/redirect to captive portal URL for Guest Access sessions. The IP address configured should not be reachable to the internet.	–	1.1.1.1
Proxy Redirection Port	The proxy port can be configured with which proxy server is enabled. This allows URLs accessed with proxy port to be redirected to the login page.	1 - 65535	–
Session Timeout	This is the duration of time, the client will be allowed to access the internet if quota persists, after which AP sends de-authentication. The wireless station has to undergo Guest Access authentication after session timeout.	60 - 2592000	28800
Inactivity Timeout	Provision to configure timeout period to disconnect wireless stations that are associated but have no data traffic. AP starts a timer when there is no data received from a wireless station and disconnects when the timer reaches zero.	60 - 2592000	1800
MAC Authentication Fallback	It is a mechanism in which wireless stations will be redirected to the Guest Access login page after any supported type of MAC address authentication failures.	–	Disabled

To configure the above parameters, navigate to the **Configure > WLAN > Guest Access** tab and provide the details as given below:

1. Enable the required access types from the **Access Policy** checkbox.
2. Enable HTTP or HTTPS from the **Redirect Mode** checkbox.
3. Enter Redirect Hostname in the textbox.
4. Enter **External Page URL** in the textbox.
5. Enable **External Portal Post Through cnMaestro** checkbox.
6. Select External Portal Type from the drop-down list.
7. Enable configured modes of redirection URL in **Success Action** checkbox.
8. Enter **Success message** to appear in the textbox.
9. Enable the required **Redirection URL Query String** checkbox.
10. Enable **Redirect** checkbox for HTTP packets.
11. Enter configuring IP address in the **Redirect User Page** textbox.
12. Enter Port number in the **Proxy Redirection Port** textbox.

13. Enter the session timeout in seconds in the **Session Timeout** textbox.
14. Enter the inactivity timeout in seconds in the **Inactivity Timeout** textbox.
15. Select the **MAC Authentication Fallback** checkbox if guest-access is used only as a fallback for clients failing MAC authentication.
16. Click **Save**.

To configure **Whitelist**:

1. Enter the IP address or the domain name of the permitted domain in the **IP Address** or **Domain Name** textbox.
2. Click **Save**.

To configure **Captive Portal bypass User Agent**:

1. Enter **HTML Response** in the textbox.
2. Click **Save**.
3. Select **Index** parameter value from the drop-down list.
4. Enter **User Agent String** parameter in the textbox.
5. Select **Status Code** from the drop-down list.

cnMaestro

The following table lists configurable fields that are displayed in the **Configuration > WLAN > Guest Access > cnMaestro** page:

Table 26: The cnMaestro parameters

Parameters	Description	Range	Default
WLAN > Guest Access > cnMaestro			
Guest Portal Name	Provision to configure the name of the Guest Access profile which is hosted on CnMaestro.	–	–
Redirect	<ul style="list-style-type: none"> If enabled, only HTTP URLs will be redirected to the Guest Access login page. If disabled, both HTTP and HTTPS URLs will be redirected to Guest Access login page. 	–	Enabled
Redirect User Page	The IP address configured in this field is used as a logout URL for Guest Access sessions. The IP address configured should be not reachable to the internet.	–	1.1.1.1
Proxy Redirection Port	The proxy port can be configured with which proxy server is enabled. This allows URLs accessed with proxy port to be redirected to the login page.	1 - 65535	–
Inactivity Timeout	Provision to configure timeout period to disconnect wireless stations that are associated but have no data traffic. AP starts a timer when there is no data received from a wireless station and disconnects when the timer reaches zero.	60 - 2592000	1800
Whitelist	Provision to configure either IPs or URLs to bypass traffic, such that user can access those IPs or URLs without Guest Access authentication.	–	–

To configure the above parameters, navigate to the **Configure > WLAN > cnMaestro** tab and provide the details as given below:

1. Enter **Guest Portal Name** which is hosted on cnMaestro in the textbox.
2. Enable **Redirect** checkbox for HTTP packets.
3. Enter configuring IP address in the **Redirect User Page** textbox.
4. Enter Port number in the **Proxy Redirection Port** textbox.
5. Enter the inactivity timeout in seconds in the **Inactivity Timeout** textbox.
6. Click **Save**.

To configure the **Whitelist** parameter:

1. Enter the IP address or the domain name of the permitted domain in the **IP Address** or **Domain Name** textbox.
2. Click **Save**.

Figure 22: The *cnMaestro* parameter

XMS/EasyPass

Below table lists configurable fields that are displayed in the **Configuration > WLAN > Guest Access > XMS/EasyPass** tab:

Table 27: XMS/EasyPass parameters

Parameters	Description	Range	Default
External Page URL	Users can configure a login page that is posted to wireless stations that are not Guest Access authenticated.	–	–
Secret	Provision to configure the secret to be used during redirection.	–	–
Whitelist	Provision to configure either IPs or URLs to bypass traffic, such that user can access those IPs or URLs without Guest Access authentication.	–	–

To configure the above parameters, navigate to the **Configure > WLAN > XMS/EasyPass** tab and provide the details as given below:

1. Enter **External Page** URL in the textbox.
2. Enter **Secret** to be used during redirection in the textbox.
3. Click **Save**.

To configure the Whitelist parameter:

1. Enter the IP address or the domain name of the permitted domain in the **IP Address** or **Domain Name** textbox.
2. Click **Save**.

Note

- For more information about XMS-Cloud EasyPass settings and onboarding, refer to the latest *XMS-Cloud Help* document.
- For more information about cnMaestro Guest Access Portal and onboarding, refer to the *cnMaestro User Guide*.

Usage Limits

Below table lists configurable fields that are displayed in the **Configuration > WLAN > Usage Limits** tab:

Table 28: Usage Limits parameters

Parameters	Description	Range	Default
Rate Limit per Client	Provision to limit throughput per client. Default allowed throughput per client is unlimited. i.e., maximum allowed by 802.11 protocols. The traffic from/to each client on an SSID can be rate-limited in either direction by configuring the client rate limit available in usage limits inside the WLAN Configuration. This is useful in deployments like public hotspots where the backhaul is limited and the network administrator would like to ensure that one client does not monopolize all available bandwidth.	–	0 [Unlimited]
Rate Limit per WLAN	Provision to limit throughout across WLAN irrespective of a number of associated wireless stations to WLAN. All upstream/downstream traffic on an SSID (aggregated across all wireless clients) can be rate-limited in either direction by configuring usage limits inside the WLAN configuration section of the GUI. This is useful in cases where multiple SSIDs are being used and say one is for corporate use, and another for guests. The network administrator can ensure that the guest VLAN traffic is always throttled, so it will not affect the corporate WLAN.	–	0 [Unlimited]

To configure the above parameters, navigate to the **Configure > WLAN > Usage Limits** tab and provide the details as given below:

1. Enter Upstream and Downstream parameters in the **Rate Limit per Client** text box.
2. Enter Upstream and Downstream parameters in the **Rate Limit per WLAN** text box.
3. Click **Save**.

Figure 24: The Usage Limits parameters

Scheduled Access

Below table lists configurable fields that are displayed in the **Configuration > WLAN > Scheduled Access** page:

Table 29: The Scheduled Access parameters

Parameters	Description	Range	Default
Scheduled Access	<p>Provision to configure the availability of Wi-Fi services for a selected time duration. Enterprise Wi-Fi AP has the capability of configuring the availability of Wi-Fi services on all days or a specific day (s) of a week. The time format is in Hours.</p> <div style="border: 1px solid black; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p>Note</p> <p>From Release 6.3 onwards, the user can configure up to a maximum of twelve schedule access rules per day on a particular WLAN instead of 1 rule per day.</p> </div>	00:00 Hrs. - 23:59 Hrs.	Disabled

To configure the above parameter, navigate to the **Configure > WLAN > Scheduled Access** tab and provide the details as given below:

1. Enter the start and end time to enable Wi-Fi access in the respective text boxes.
2. Click **Save**.

Figure 25: The Scheduled Access parameters

The screenshot shows the 'Scheduled Access' configuration page. At the top, there are tabs for 'Basic', 'Radius Server', 'Guest Access', 'Usage Limits', 'Scheduled Access' (which is selected), 'Access', and 'Passpoint'. Below the tabs, the interface is organized into a grid for each day of the week: Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday. For each day, there are two input fields: 'Start Time' and 'End Time'. To the right of each 'End Time' field, the text 'HH:MM format' is displayed. At the bottom right of the grid, there are two buttons: 'Save' and 'Cancel'.

CLI Configuration:

```
XV3-8-EC7708(config)# wireless wlan 1
XV3-8-EC7708(config-wlan-1)# scheduled-access
all : all
friday : friday
monday : monday
saturday : saturday
sunday : sunday
thursday : thursday
tuesday : tuesday
wednesday : wednesday
weekday : weekday
weekend : weekend
XV3-8-EC7708(config-wlan-1)# scheduled-access all
Time period in HH:MM-HH:MM,HH:MM-HH:MM format
```

Access

Below table lists configurable fields that are displayed in the **Configuration > WLAN > Access** tab:

Table 30: The Access parameters

Parameters	Description	Range	Default
DNS-ACL			
Precedence	Provision to configure index of ACL rule. Packets are validated and processed based on the Precedence value configured.	-	1
Action	Provision to configure whether to allow or deny traffic.	-	Deny
Domain	Provision to configure domain names and rules are applied based on Action configured.	-	-
MAC Authentication			
MAC Authentication Policy	Enterprise Wi-Fi AP supports multiple methods of MAC authentication. Following are the details of each mode: 1. Permit Wireless station MAC addresses listed will be allowed to associate to AP. 2. Deny When the user configures a MAC address, those wireless stations shall be denied to associate and the non-listed MAC address will be allowed.	-	Deny

Parameters	Description	Range	Default
	<p>3. Radius</p> <p>For every wireless authentication, AP sends a radius request and if radius acceptance is received, then the wireless station is allowed to associate.</p> <p>4. cnMaestro</p> <p>This option is preferable when the administrator prefers a centralized MAC authentication policy. For every wireless authentication, AP a sends query to cnMaestro if it is allowed or disallowed to connect. Based on the configuration, wireless stations are either allowed or denied.</p>		

To configure the above parameter, navigate to the **Configure > WLAN > Access** tab and provide the details as given below:

To configure **DNS ACL**:

1. Select **Precedence** from the drop-down list.
2. Select type of action from **Action** drop-down list.
3. Enter a domain name in the **Domain** textbox.
4. Click **Save**.

To configure **MAC Authentication**:

1. Select **MAC Authentication Policy** from the drop-down list.
2. Enter **MAC** in the textbox.
3. Enter **Description** in the textbox.
4. Click **Save**.

Figure 26: The Access parameters

The screenshot displays the 'Access' configuration page with the following sections:

- Navigation:** Basic, Radius Server, Guest Access, Usage Limits, Scheduled Access, **Access**, Passpoint, Delete.
- DNS-ACL Section:**
 - Fields: Precedence (1), Action (Deny), Domain (empty).
 - Table: Precedence, Policy, Domain Name, Action. Content: No Rules available.
 - Footer: 1 / 1, 10 items per page.
- MAC Authentication Section:**
 - Fields: MAC Authentication Policy (Deny), MAC (empty), Description (empty).
 - Table: MAC Address, Action, Description. Content: No MAC Address available.
 - Footer: 1 / 1, 10 items per page.

Sample DNS-ACL configuration

If any user wants to block Facebook or Youtube traffic and allow the rest of the traffic, the configuration is shown in below figure:

Figure 27: Sample DNS-ACL configuration

Precedence	Policy	Domain
1	deny	*facebook.com
2	deny	*youtube.com
256	permit	*.*

Passpoint

Below table lists configurable fields that are displayed in the **Configuration > WLAN > Passpoint** tab:

Table 31: Passpoint parameters

Parameters	Description	Range	Default
Configuration > Hotspot2.0 / Passpoint			
Enable	Passpoint (Release 2) enables secure hotspot network access, online sign-up, and policy provisioning.	–	Disabled
DGAF	Downstream Group Addressed Forwarding when enabled the WLAN does not transmit any multicast and broadcast packets.	–	Disabled
ANQP Domain ID	ANQP domain identifier is included when the HS 2.0 indication element is in Beacon and Probe Response frames.	0-65535	0
Comeback Delay	Comeback Delay in milliseconds.	100-2000	0
Access Network Type	The configured Access Network Type is advertised to STAs. Following are the different network types supported: <ul style="list-style-type: none"> • Private • Chargeable Public • Emergency Services • Free Public • Personal Device • Private with Guest • Test • Wildcard 	–	Private
ASRA	This indicates that the network requires a further step for access.	–	Disabled
Internet	The network provides connectivity to the Internet if not specified.	–	Disabled
HESSID	Configures the desired specific HESSID network identifier or the wildcard network identifier.	–	–
Venue Info	Configure venue group and venue type.	–	–
Roaming Consortium	The roaming consortium and/or SSP whose security credentials can be used to authenticate with the AP.	–	–

Parameters	Description	Range	Default
ANQP Elements	Select any one of the following: <ul style="list-style-type: none"> • 3GPP Cellular Network Information • Connection Capability • Domain Name List • Icons • IP Address Type information • NAI Realm List • Network Authentication Type • Operating Class Indication • Operator Friendly Names • OSU Provider List • Venue Name Information • WAN Metrics 	–	–

To configure the above parameter, navigate to the **Configure > WLAN > Passpoint** tab and provide the details as given below:

1. Select **Enable** checkbox to enable passpoint functionality.
2. Select the **DGAF** checkbox to enable Downstream Group Addressed Forwarding functionality.
3. Enter the domain identifier value in the **ANQP Domain ID** textbox.
4. Enter **Comeback Delay** in milliseconds in the textbox.
5. Choose the **Access Network Type** value from the drop-down list.
6. Enable the **ASRA** checkbox if the network requires additional steps for access.
7. Enable **Internet** checkbox for the network to provide connectivity to the Internet.
8. Enter the **HESSID** to configure the desired specific HESSID network identifier or the wildcard network identifier.
9. Select **Venue Info** from the drop-down list.
10. To add **Roaming Consortium** value, enter the value in the textbox and click **Add**. To delete a **Roaming Consortium** value, select from the drop-down list and click **Delete**.
11. Click **Save**.

Figure 28: The Passpoint parameters

The screenshot shows the 'Passpoint' configuration page with the following settings:

- Enable:** Passpoint (Release 2) enables a secure hotspot network access, online sign up and Policy Provisioning
- DGAF:** Downstream Group Addressed Forwarding, When enabled the WLAN doesn't transmit any multicast and broadcast packets
- ANQP Domain ID:** 0 (ANQP domain identifier (0-65535) included when the HS 2.0 Indication element is in Beacon and Probe Response frames)
- Comeback Delay:** 0 (Comeback delay in milliseconds. Supported range is 100-2000 ms, use 0 to disable)
- Access Network Type:** Private (The configured Access Network Type is advertised to STAs)
- ASRA:** Additional Step Required for Access, indicate that the network requires a further step for access
- Internet:** The network provides connectivity to the Internet, Otherwise unspecified
- HESSID:** (Configure the desired specific HESSID network identifier or the wildcard network identifier)
- Venue Info:** Please select (Configure Venue group and Venue type)
- Roaming Consortium:** (The roaming consortium and/or SSP whose security credentials can be used to authenticate with the AP)

ANQP Elements (Access Network Query Protocol)

ANQP: Please Select

Summary

Hotspot2.0 / Passpoint			
Status	Disable	DGAF	Disable
Access Network Type	Private	ASRA	No

		Internet	Not Available

Radius attributes

The table below shows the attributes processed by the CaOS and describes their interpretation.

Table 32: Radius attributes parameters

Type	Attribute Name	Attribute Number	Purpose
Standard	Acct-Interim-Interval	85	Specifies the interval between accounting interim updates
Standard	Acct-Session-Id	44	Session identification (RFC 5176)
Standard	Calling-Station-Id	31	Session identification (RFC 5176)
Standard	Class	25	Accounting classification
Standard	Event-	55	Replay protection (RFC 5176)

Type	Attribute Name	Attribute Number	Purpose
	Timestamp		
Standard	Filter-ID	11	<ul style="list-style-type: none"> Assign station to a user group Re-assign station to a different user group (RFC 5176)
Standard	Framed-IP-Address	8	Session identification (RFC 5176)
Standard	Idle-Timeout	28	Specifies the amount of time a station may remain idle before its session is terminated
Standard	NAS-IP-Address	4	NAS identification (RFC 5176)
Standard	NAS-Identifier	32	NAS identification (RFC 5176)
Standard	Session-Timeout	27	Specifies the interval at which session is terminated
Standard	Termination-Action	29	Specifies the action to take when the session is terminated
Standard	Tunnel-Type	64	Dynamic VLAN assignment (1 of 3 required), should be set to VLAN (Integer = 13)
Standard	Tunnel-Medium-Type	65	Dynamic VLAN assignment (2 of 3 required), should be set to 802 (Integer = 6)
Standard	Tunnel-Private-Group-ID	81	Dynamic VLAN assignment (3 of 3 required), should be set to the VLAN ID or name
Standard	User-Name	1	<ul style="list-style-type: none"> Station username update Session identification (RFC 5176)
Microsoft Vendor-Specific	MS-MPPE-Send-Key	16	Session key distribution
Microsoft Vendor-Specific	MS-MPPE-Recv-Key	17	Session key distribution
Cambium Vendor-Specific	Cambium-Vlan-Pool-Id	157	Radius based VLAN pool
Nas Port ID	NAS-Port-Id	87	NAS identification (RFC 5176)

Enterprise PSK (ePSK)

By using the ePSK feature, users can configure and support individual PSK keys for different clients. This feature can be configured under a given WLAN configuration in cnMaestro UI. For on devices, only CLI support is available.

This feature also supports individual VLAN assignments for a given key which helps to put client traffic on different VLANs for limiting broadcast traffic.

Note:

ePSK scale is a [Premium feature](#) where users can configure more than 300 ePSK (up to 2000 ePSK) per WLAN and it is controlled by cnMaestro X.

Table 33: Maximum ePSK Keys per platform

Platform	Maximum ePSK Keys
XV3-8	2000
XE5-8	2000
XV2-2	2000
XV2-21X	2000
XV2-23T	2000
XV2-22H	2000
XV2-2T0	2000
XV2-2T1	2000
XE3-4	2000
XE3-4TN	2000

ePSK expiry

Note:

This feature is available from cnMaestro 4.1.0 and later versions only.

APs allow users to automatically expire ePSK details after a specific duration of time. The following options are available to expire the ePSK details:

- **None:** ePSK details never expire.
- **Date and Time:** ePSK expires after the specified date and time (in the dd/mm/yyyy hh:mm AM/PM format)
Supported minimum time is 12 A.M. on the next day and the maximum is five years.
- **Duration:** ePSK expires after the specified (in hours, days, months, or years) in the Expiry by drop-down.

Supported minimum duration is one hour and the maximum is five years. No decimal values are supported, for example, 1.5 hours.

Select **None** to never expire the ePSK credentials.

Note:

- The configured expiry time appears in the **Expiration Date** column on the **WLANs > <WLAN name>** page in the cnMaestro UI.

- The **Status** column on the **WLANs** > <WLAN name> page in the cnMaestro UI displays the status of the ePSK details—**Active**, **Expired**, or **None**.

None is displayed only when older ePSK keys are imported to cnMaestro.

- Expired ePSK details are deleted from the AP only when the next configuration sync functionality is initiated or when there is a configuration change in the AP.

For more information on configuring ePSK expiry, refer to the *cnMaestro User Guide*.

Creating a Personal Wi-Fi ePSK

Note:

This feature is available from cnMaestro 4.1.0 and later versions only.

In Multiple Dwelling Units (MDU), personal Wi-Fi allows a user to connect all the personal devices to a unique SSID associated with a VLAN.

To configure personal W-Fi on the AP, complete the following steps in the cnMaestro UI:

1. Add and enable the SSID details (to be used as personal Wi-Fi) in the **WLANs** tab, under **Manage and Operation** > **Networks** > <network name> > **Configuration** > **Device Configuration** > **Advanced Settings** section.
 - a. Select the **Enable SSID** checkbox.
 - b. In the **Passphrase** field, configure the passphrase.
 - c. Configure the VLAN with which the SSID must be associated.
2. Enable personal Wi-Fi on the ePSK page for the WLAN profile by selecting the **Base Personal SSID** checkbox.

By default, this feature is disabled. Once enabled, the **Enable** checkbox (under **WLANs** > **WLAN** > **Basic Settings** > **SSID**) is cleared. Also, the local and RADIUS ePSKs are disabled.

For more information on configuring personal Wi-Fi, refer to the *cnMaestro User Guide*.

RADIUS based ePSK [Premium feature](#)

Cambium Networks ePSK feature is an extension of WPA2 PSK where multiple passphrases can be assigned to a single SSID. The Wi-Fi clients can have unique passphrases that can be used by each client using this feature. The same feature has been now extended to RADIUS.

The RADIUS server can provide the matching PMK for a given client, and corresponding standard RADIUS attributes can be enforced for a client session. This requires custom development on the RADIUS server.

Note:

ePSK feature is not supported with WPA3.

Configuration CLI:

```
XV3-8-EC7708(config)# wireless wlan 1
```

```
XV3-8-EC7708(config-wlan-1)# epsk
```

```
RADIUS : Configure RADIUS based ePSK
```

```
username : Configure Username
XV3-8-EC7708(config-wlan-1)# epsk RADIUS
XV3-8-EC7708(config-wlan-1)# save
```

Groupwise Transient Key (GTK) per VLAN

The APs support dynamic VLAN via ePSK/RADIUS based/VLAN-pool feature on a given WLAN profile. The client traffic is tagged as per the VLAN assigned dynamically. The unicast traffic works fine as each client generates a unique PTK. However, the AP provides common GTK for all the clients associated with the WLAN profile irrespective of the VLAN that belongs to. This causes all clients irrespective of the VLAN assigned can receive broadcast/multicast data traffic of other VLAN traffic.

The solution is to generate the GTK per VLAN and forward it to clients as part of the WPA2 handshake. So that the broadcast/multicast data traffic is encrypted using GTK based on the VLAN tag of the packet. The maximum number of GTKs supported is 127 per radio. By default it is disabled.

cnMaestro configuration:

AP Groups > Ent_Mesh_ZeroTouch_APGrp

Dashboard Notifications **Configuration** Statistics Devices Clients Mesh Peers

Services

User-Defined Overrides

User-Defined Overrides

Advanced configuration settings entered below will be applied on top of the AP Group settings sent to the device. This allows you to apply configuration not supported in the previous screens. If there are conflicts, the below settings will take precedence. The format used is the same as a configuration file exported from the device via its web UI or the "View Device Configuration" link in the device level configuration page.

Variables and Macros

ⓘ Settings entered are not validated or error-checked (However, dollar (\$), period (.) or space characters are not allowed in a variable name and it should not be more than 64 characters long), and they may overwrite configuration made in previous screens, so please use them with caution. You are responsible for ensuring the resulting AP Group is valid and safe to use.

```
!
wireless wlan 1
gtk-per-vlan
!
```

Configuration CLI:

```
XV3-8-EC7708(config)# wireless wlan 1
XV3-8-EC7708(config-wlan-1)# gtk-per-vlan
```

Chapter 7: Configuring the Network

This chapter describes the following topics

- [Overview](#)
- [Configuring Network parameters](#)

Overview

This chapter gives an overview of the Enterprise Wi-Fi AP configuration parameters related to LAN, VLAN, Routes, DHCP server, ACL, and Firewall.

Configuring Network parameters

Enterprise Wi-Fi AP network configuration parameters are segregated into the following sections:

- [VLAN](#)
- [Routes](#)
- [Ethernet Ports](#)
 - [Port Control—802.1X Authentication](#)
- [Security](#)
- [DHCP](#)
- [Tunnel](#)
- [PPPoE](#)
- [VLAN Pool](#)

IPv4 network parameters

VLAN

Below table lists the fields that are displayed in **Configure > Network > VLAN** tab:

Table 34: VLAN (IPv4) parameters

Parameters	Description	Range	Default
VLAN > IPv4			
Edit	Provision to select the VLAN interface that the user is intended to view/update the configuration.	–	VLAN 1
Address	Provision to configure the mode of IPv4 address configuration for an interface selected. Two modes are supported: <ul style="list-style-type: none">• DHCP—This is the default mode in which the Enterprise Wi-Fi AP device tries to obtain an IPv4 address from the DHCP server.• Static IP—Users must explicitly configure the IPv4 address and Netmask for a VLAN selected.	–	DHCP

Parameters	Description	Range	Default
NAT	This option enables wireless traffic gets NAT'ed with APs respective uplink interface IP. This option is recommended when DHCP pools are configured in AP.	–	Disabled
Zeroconf IP	Zeroconf IP is recommended to be enabled. This interface is available only in the VLAN1 configuration section. If VLAN 1 is not allowed in Ethernet interfaces, this IP will not be accessible.	–	Enabled
DHCP Relay Agent	<p>This option is enabled when DHCP server is hosted on a VLAN which is not same as client that is requesting the DHCP IP. Enabling this appends Option 82 in the DHCP packets. Following information is allowed to configure:</p> <ul style="list-style-type: none"> • DHCP Option 82 Circuit ID Configurable parameters under this option are as follows: <ul style="list-style-type: none"> • Hostname • APMAC • BSSID • SSID • Custom • DHCP Option 82 Remote ID Configurable parameters under this option are as follows: <ul style="list-style-type: none"> • Hostname • APMAC • BSSID • SSID • Custom <div style="border: 1px solid black; background-color: #e1f5fe; padding: 5px; margin-top: 10px;"> <p> Note In case DHCP Option 82 is configured at the device-, WLAN profile-, and L3 interface-levels, the following priority order is considered:</p> <ol style="list-style-type: none"> 1. Device-level configuration 2. WLAN profile-level configuration 3. L3 interface-level configuration </div>	–	Disabled
Request Option All	<p>This configuration decides the interface on which Enterprise Wi-Fi AP will learn the following:</p> <ul style="list-style-type: none"> • IPv4 default gateway 	–	Enabled on VLAN1

Parameters	Description	Range	Default
	<ul style="list-style-type: none"> DHCP client options like Option 43 and Option 15 (Controller discovery like controller host name / IPv4 address) DNS Servers Domain Name 		

To configure the above parameter, navigate to the **Configure > Network > VLAN** tab and provide the details as given below:

To configure VLAN IPv4:

1. Select **Edit** check box to enable VLAN1 functionality.
2. Enable **DHCP** or **Static IP** mode of IPv4 address configuration from the **Address** check box.
3. Enable **NAT** check box.
4. Enable **Zeroconf IP** check box.
5. Enter **DHCP Relay Agent** parameter in the text box.
6. Select **DHCP Option 82 Circuit ID** from the drop-down list.
7. Select **DHCP Option 82 Remote ID** from the drop-down list.
8. Enable **Request Option All** check box.
9. Click **Save**.

Figure 29: Network (IPv4) parameters

The screenshot displays the configuration page for a VLAN interface. At the top, there are navigation tabs: VLAN, Routes, Ethernet Ports, Security, DHCP, Tunnel, PPPoE, and VLAN Pool. The main content area is titled 'VLAN' and shows 'Edit VLAN 1' with a 'Delete this interface' button and an 'Add new L3 Interface' button. The 'IPv4' configuration section is highlighted with a red border and contains the following settings:

- Address:** DHCP
- NAT:** When NAT is enabled, IP addresses under this SVI are hidden
- Zeroconf IP:** Support 169.254.x.x local IP address
- DHCP Relay Agent:** xxx.xxxx.xxxx.xxxx (with a note: Enables relay agent and assign DHCP server to it)
- DHCP Option 82 Circuit ID:** None
- DHCP Option 82 Remote ID:** None
- Request Option All:** Enable dhcp request option all on this interface

Below the IPv4 section, there are expandable sections for IPv6 and General.

DHCP Client Options

Enterprise Wi-Fi AP devices learn multiple DHCP options for all VLAN interfaces configured on the device. Based on configured criteria, values of these options are used by the system. The below table lists the different DHCP options.

Table 35: DHCP Options

Options	Description	Usage	Reference CLI
Option 1	The subnet mask option specifies the client's subnet mask as per RFC 950.	Based on the state of "Request Option All", the device chooses a subnet mask from the respective VLAN interface.	show ip route
Option 3	This option specifies a list of IP addresses for routers on the client's subnet.	Based on the state of "Request Option All", the device chooses a route learned from the respective VLAN interface. The only first route is honored.	show ip route
Option 6	The domain name server option specifies a list of Domain Name System (STD 13, RFC 1035) name servers available to the client. Servers SHOULD be listed in order of preference.	Based on the state of "Request Option All", the device chooses a subnet mask from the respective VLAN interface. the top two DNS servers are honored by Enterprise Wi-Fi AP devices.	show ip name-server
Option 15	This option specifies the domain name that the client should use when resolving hostnames via the Domain Name System.	More details are provided in Option 15.	show ip dhcp-client info
Option 26	This option specifies MTU size in a network.	More details are provided in Configuring the Network.	show ip dhcp-client info
Option 28	This option specifies the broadcast address that the client should use.	A broadcast address learned for all VLAN interfaces are used respectively as per standards	show ip dhcp-client-info
Option 43	This option is used to help the AP in obtaining the cnMaestro IP address from the DHCP server while a DHCP request to get an IP address is sent to the DHCP server.	More details are provided in Option 43 (cnMaestro On-Premises 2.4.0 User Guide).	show ip dhcp-client info
Option 51	This option is used in a client request to allow the client to request a lease time for the IP address. In a server reply, a DHCP server uses this option to specify the lease time it is willing to offer.	Enterprise Wi-Fi AP renew leases for all VLAN interfaces configured based on lease time that has been learned from the DHCP server.	show ip dhcp-client info

Options	Description	Usage	Reference CLI
Option 54	DHCP clients use the contents of the server identifier field as the destination address for any DHCP messages unicast to the DHCP server.	Enterprise Wi-Fi AP learns DHCP server IP for all VLAN interfaces configured.	show ip dhcp-client info
Option 60	This option is used by DHCP clients to optionally identify the vendor type and configuration of a DHCP client.	For Enterprise Wi-Fi AP device, value is updated as Cambium-Wi-Fi-AP.	show ip dhcp-client info

DHCP Option 43—Zero-touch onboarding

This option is used to help the AP in obtaining cnMaestro/XMS IP address from the DHCP server while a DHCP request to get an IP address is sent to the DHCP server.

With Release 6.4, this option is used to learn HTTPS Proxy server address from the DHCP server as well.

DHCP Option 43 format

From Release 6.4 onwards, a new way of Option 43 format is supported. If HTTP proxy needs to be configured then the following format should be used:

The cnMaestro/XMS URL and HTTPS proxy URL can be packed into Option 43 payload in a key-value pair separated by ',' like <key=value,key=value>. Key and its value are separated by '=' character.

For example, 0=CMBM;1=cloud.cambiumnetworks.com;2=http://user:userpass@IP/URL:port, where identifiers are listed below:

- 0 is for header CMBM - **Mandatory**
- 1 is for the server's URL
- 2 is for HTTP proxy URL

Note

If only cnMaestro/XMS URL configuration is needed then Option 43 payload can contain only that too without key-value format as described above.

Routing and DNS

Table 36: Configure: Network > VLAN > Routing & DNS > IPv4 parameters

Parameters	Description	Range	Default
Default Gateway	Provision to configure the default gateway. If this is provided, Enterprise Wi-Fi AP device installs this gateway as this is the highest priority.	–	–
DNS Server	Provision to configure Static DNS server on Enterprise Wi-Fi AP device. A maximum of two DNS servers can be configured.	–	–

Parameters	Description	Range	Default
Domain Name	Provision to configure Domain Name. If this is provided, Enterprise Wi-Fi AP device installs this Domain Name as this is the highest priority.	–	–
DNS Proxy	Enterprise Wi-Fi AP device can act as DNS proxy server when this parameter is enabled.	–	Disabled

To configure the above parameter, navigate to the **Configure > Network > VLAN > Routing & DNS** tab and provide the details as given below:

1. Enter **Default Gateway** IPv4 address in the text box.
2. Enter **Domain** Name in the text box.
3. Enter primary domain server name in the **DNS Server 1** text box.
4. Enter secondary domain server name in the **DNS Server 2** text box.
5. Enable **DNS Proxy** check box.
6. Click **Save**.

Figure 30: Routing & DNS (IPv4) parameters

The screenshot shows the 'Routing & DNS' configuration page. Under the 'IPv4' tab, there are five rows of configuration options:

- Default Gateway:** A text input field with the placeholder text 'IP address of default gateway'.
- DNS Server 1:** A text input field with the placeholder text 'Primary Domain Name Server'.
- DNS Server 2:** A text input field with the placeholder text 'Secondary Domain Name Server'.
- Domain Name:** A text input field with the placeholder text 'Domain name'.
- DNS Proxy:** A checkbox labeled 'DNS Proxy'.

Below the configuration area, there is a 'Save' button and a 'Cancel' button.

Routes

Below table lists the fields that are displayed in **Configure > Network > Routes** tab:

Table 37: Routes (IPv4) parameters

Parameters	Description	Range	Default
Gateway Source Precedence	Provision to prioritize default gateway and DNS servers when Enterprise Wi-Fi AP device has learned from multiple ways. Default order is Static and DHCP.	–	Static
Add Multiple Route Entries	The user has provision to configure static Routes. Parameters that are required to configure static Routes are as follows: <ul style="list-style-type: none"> • Destination IP • Mask • Gateway 	–	–
Port Forwarding	This feature is required when wireless stations are behind NAT. Users can access the services hosted on wireless stations using this feature. Following configurable parameters are required to gain access to services hosted on wireless stations which are behind: <ul style="list-style-type: none"> • Port • IP Address • Type 	–	–

To configure the above parameter, navigate to the **Configure > Network > Routes** tab and provide the details as given below:

To configure Gateway Source Precedence:

1. Select **STATIC** or **DHCPC** from the **Gateway Source Precedence** check box.
2. Click **Save**.

To configure Add Multiple Route Entries:

1. Enter **Destination IP** address in the text box.
2. Enter **Mask IPv4** address in the text box.
3. Enter **Gateway IPv4** address in the text box.
4. Click **Save**.

To configure Port Forwarding:

1. Enter **Port** in the text box.
2. Enter **IP Address** in the text box.
3. Select **Type** from the drop-down list.
4. Click **Save**.

IPv6 network parameters

VLAN

Table 38: VLAN (IPv6) parameters

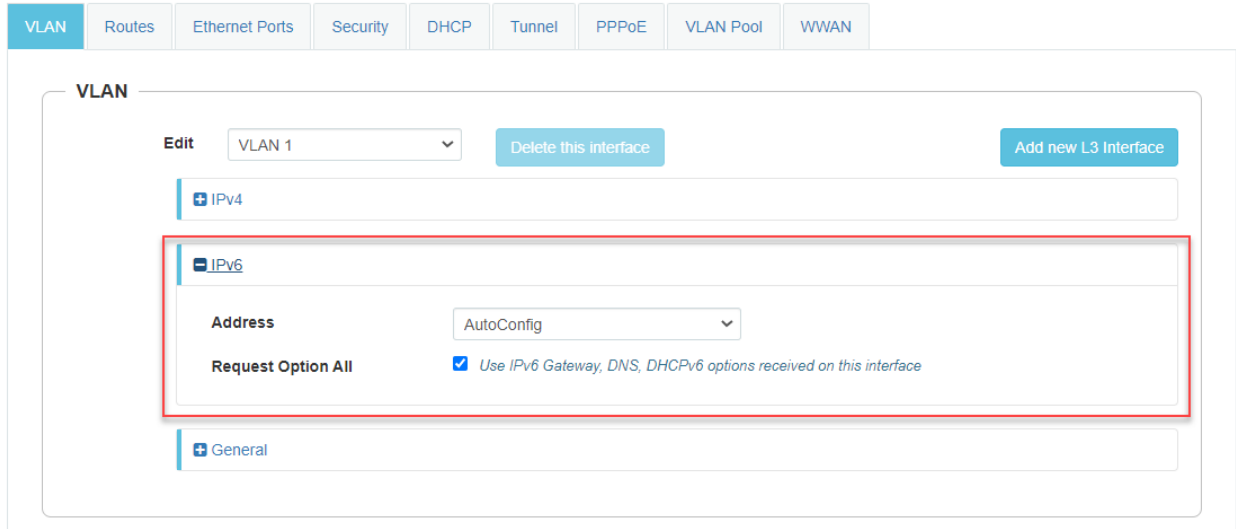

Parameters	Description	Range	Default
Address	Provision to configure the mode of IPv6 address configuration for an interface selected. Five modes are supported: <ul style="list-style-type: none">• Disabled• AutoConfig• Static• Stateless DHCPv6• Stateful DHCPv6	–	AutoConfig
Request Option All	This configuration decides the interface on which AP will learn the following: <ul style="list-style-type: none">• IPv6 default gateway• DHCP client options like Option 52 and Option 24 (Controller discovery like controller hostname / IPv6 address)• DNS Servers• Domain Name	–	Enabled on VLAN1

To configure the above parameter, navigate to the **Configure > Network > VLAN** tab and provide the details as given below:

To configure **VLAN IPv6**:

1. Select required IPv6 address configuration from the **Address** drop-down list.
2. Enable **Request Option All** check box.
3. Click **Save**.

Figure 32: VLAN (IPv6) parameters

Routing & DNS

Table 39: Routing & DNS (IPv6) parameters

Parameters	Description	Range	Default
Default Gateway	Provision to configure the default gateway. If this is provided, Enterprise Wi-Fi AP device installs this gateway as this is the highest priority.	–	–
DNS Server	Provision to configure Static DNS server on Enterprise Wi-Fi AP device. A maximum of two DNS servers can be configured.	–	–
Domain Name	Provision to configure Domain Name. If this is provided, Enterprise Wi-Fi AP device installs this Domain Name as this is the highest priority.	–	–
IPv6 Preference	When enabled, IPv6 is preferred over IPv4 based on DNS response.	–	Disabled

To configure the above parameter, navigate to the **Configure > Network > Routing & DNS tab** and provide the details as given below:

1. Enter **Default Gateway IPv6** address in the text box.
2. Enter primary domain server name in the **DNS Server 1** text box.
3. Enter secondary domain server name in the **DNS Server 2** text box.
4. Enter **Domain Name** in the text box.
5. Enable **IPv6 Preference** check box.
6. Click **Save**.

Figure 33: Routing & DNS (Pv6) parameters

The screenshot shows a configuration window titled "Routing & DNS". At the top, there are two tabs: "IPv4" and "IPv6". The "IPv6" tab is selected and highlighted with a red border. Below the tabs, there are several configuration fields:

- Default Gateway:** A text input field with a placeholder "IP address of default gateway".
- DNS Server 1:** A text input field with a placeholder "Primary Domain Name Server".
- DNS Server 2:** A text input field with a placeholder "Secondary Domain Name Server".
- Domain Name:** A text input field with a placeholder "Domain name".
- IPv6 Preference:** A checkbox labeled "Prefer IPv6 address over IPv4 for addresses resolved via DNS".

At the bottom of the window, there are two buttons: "Save" and "Cancel".

Routes

Table 40: Routes (IPv6) parameters

Parameters	Description	Range	Default
Gateway Source Precedence	Provision to prioritize default gateway and DNS servers when Enterprise Wi-Fi AP device has learned from multiple ways. Default order is Static and AUTO-CONFIG/DHCP.	–	Static
Add Multiple Route Entries	The user has provision to configure static Routes. Parameters that are required to configure static Routes are as follows: <ul style="list-style-type: none"> • Destination IP/prefix • Gateway 	–	–

To configure the above parameter, navigate to the **Configure > Network > Routes** tab and provide the details as given below:

To configure **Gateway Source Precedence**:

1. Select STATIC or AUTO-CONFIG/DHCP from the **Gateway Source Precedence** check box.
2. Click **Save**.

To configure **Add Multiple Route Entries**:

1. Enter **Destination IP/prefix** address in the text box.
2. Enter **Gateway IPv6** address in the text box.
3. Click **Save**.

General network parameters

Table 41: VLAN (General) parameters

Parameters	Description	Range	Default
Management Access	Provision to restrict the access of devices in all modes CLI (Telnet, SSH), GUI (HTTP, HTTPS), and SNMP. Users can configure restriction of device access as follows: <ul style="list-style-type: none"> Block Allow from Wired Allow from both wired and wireless 	–	Allow from both Wired and Wireless

Select Management Access to configure restriction of the device from the drop-down list.

Figure 35: VLAN (General) parameters

Ethernet Ports

Below table lists the fields that are displayed in **Configure > Network > Ethernet Ports** tab.

Table 42: Ethernet Ports parameters

Parameters	Description	Range	Default
Ethernet	Enterprise Wi-Fi AP devices Ethernet port is provisioned to operate in the following modes: <ul style="list-style-type: none"> Access Single VLAN—Single VLAN traffic is allowed in this mode. Trunk Multiple VLANs—Multiple VLANs are supported in this mode. 	–	Access Single VLAN

To configure the above parameter, navigate to the **Configure > Network > Ethernet Ports** tab and provide the details as given below:

1. Select **Access Single VLAN** or **Trunk Multiple VLANs** from the **ETH1** drop-down list.
2. Enter **Access Mode** in the text box.
3. Click **Save**.

Figure 36: Ethernet Ports parameters

Port Control—802.1X Authentication

802.1X authentication on Ethernet ports enhance the network security of the AP. The AP supports 802.1X port-based authentication in the single-host authentication mode. In this mode, only one client is allowed to access the network after successful 802.1X port-based authentication. After successful authentication, the port VLAN is assigned based on RADIUS assigned VLAN.

Note

- 802.1X port-based authentication does not support CoA messages.

802.1X port-based authentication requires a RADIUS AAA server for authentication and accounting.

The following table lists the parameters for configuring the RADIUS AAA server on Ethernet ports available on the **Configuration > Network > Ethernet Ports > RADIUS Server** page:

Table 43: RADIUS Server parameters

Parameters	Description	Range	Default
Authentication Server	Specifies the authentication server details, such as: <ul style="list-style-type: none"> • Host—IPv4 or IPv6 address or hostname of the server • Secret—Text string that is used to encrypt data in RADIUS packets shared between the AP and the sever. Format—Text string • Port—Port number of the authentication server. Default—1812 	-	Disabled

Parameters	Description	Range	Default
	A maximum of three RADIUS authentication servers can be configured.		
Accounting Server	<p>Specifies the accounting server details, such as:</p> <ul style="list-style-type: none"> • Host—IPv4 or IPv6 address or hostname of the server • Secret—Text string that is used to encrypt data in RADIUS packets shared between the AP and the sever. Format—Text string • Port—Port number of the accounting server. Default—1813 <p>A maximum of three RADIUS accounting servers can be configured.</p>	-	Disabled
Timeout	Time (in seconds) to wait for a response from the RADIUS server.	1–30	3
Attempts	Number of retry attempts for contacting the RADIUS server.	1–3	1
Accounting Mode	<p>Specifies the accounting mode to be used. The following modes are supported:</p> <ul style="list-style-type: none"> • Start-Stop—Accounting packets are transmitted by APs to the AAA server when a wireless client is connected and when the client disconnects. • Start-Interim-Stop—Accounting packets are transmitted by APs to the AAA server when a wireless client connects, then at regular intervals (configured in the Interim Update Interval field) and also when the client disconnects. • None—Disables the accounting mode. This is the default mode. 	-	None (Disabled)
Accounting Packet	<p>Specifies whether the AP must send the Accounting-On message to every client when connected.</p> <p>Select the check box to enable.</p>	-	Disabled
Server Pool Mode	<p>Users can configure multiple Authorization and Accounting servers. Based on a number of wireless stations, the user can choose Failover mode.</p> <ul style="list-style-type: none"> • Load Balance—AP equally distributes the requests between the configured RADIUS servers, • Failover—AP selects the RADIUS server that is functional based on the order of configuration. 	-	Failover

Parameters	Description	Range	Default
NAS Identifier	This is a configurable parameter and is appended in the RADIUS request packet.	-	AP hostname (System Name)
NAS IP	NAS IP address to be included in the outgoing RADIUS request packets.	-	AP-IP (Device IP)
Interim update interval	Time (in seconds) to wait for sending RADIUS interim accounting update packets. Note: This interval is applicable only when you select the Start-Interim-Stop option in the Accounting Mode parameter.	10–65535	1800
Dynamic Authorization	This option is required, where there is CoA request from AAA/RADIUS server.	-	Disabled
Called Station ID	The following information can be communicated to the RADIUS server: <ul style="list-style-type: none"> • AP-MAC • AP-MAC: SITE-NAME • AP-NAME • AP-NAME: SITE-NAME • SITE-NAME • CUSTOM 	-	AP-MAC

Figure 37: RADIUS Server parameters

The screenshot shows the configuration page for RADIUS Server parameters. The interface includes tabs for VLAN, Routes, Ethernet Ports, Security, DHCP, Tunnel, PPPoE, VLAN Pool, and WWAN. Under Ethernet Ports, Eth1 and Eth2 are visible. The RADIUS Server section is expanded, showing the following fields:

- Authentication Server 1:** Host, Secret, Port (1812)
- Authentication Server 2:** Host, Secret, Port (1812)
- Authentication Server 3:** Host, Secret, Port (1812)
- Timeout:** 3 (Timeout in seconds of each request attempt (1-30))
- Attempts:** 1 (Number of attempts before giving up (1-3))
- Accounting Server 1:** Host, Secret, Port (1813)
- Accounting Server 2:** Host, Secret, Port (1813)
- Accounting Server 3:** Host, Secret, Port (1813)
- Timeout:** 3 (Timeout in seconds of each request attempt (1-30))
- Attempts:** 1 (Number of attempts before giving up (1-3))
- Accounting Mode:** None (Configure accounting mode)
- Server Pool Mode:** Load Balance (Load balance requests among the configured RADIUS servers) or Failover (Failover requests (using others configured servers only when one is down))
- NAS Identifier:** AP-HOSTNAME (NAS-Identifier attribute for use in Request packets. Defaults to system name)
- NAS IP:** AP-IP (NAS-IP attribute for use in Request packets. Defaults to Device IP)
- Called Station ID:** AP-MAC (Configure AP-MAC as Called-Station-Id in the RADIUS packet)
- Interim Update Interval:** 1800 (Interval for RADIUS Interim-Accounting updates (10-65535 Seconds))
- Dynamic Authorization:** Enable RADIUS dynamic authorization (COA, DM messages)

General network parameters

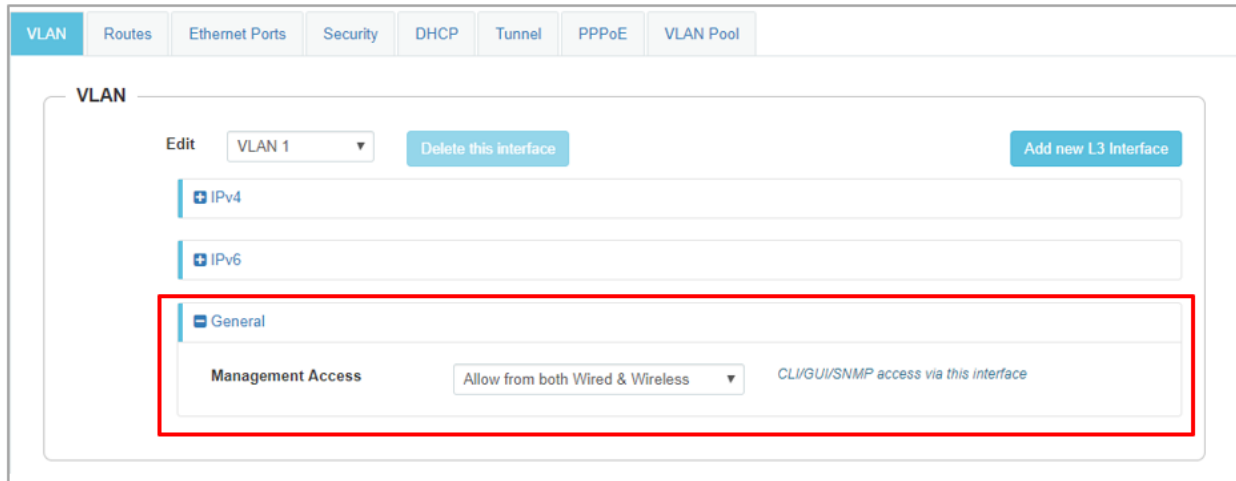

Below table lists the fields that are displayed in **Configure > Network > VLAN > General parameters** tab:

Table 44: The General parameters

Parameters	Description	Range	Default
Management Access	Provision to restrict the access of devices in all modes CLI (Telnet, SSH), GUI (HTTP, HTTPS), and SNMP. Users can configure restriction of the device access as follows: <ul style="list-style-type: none"> Block Allow from Wired Allow from both wired and wireless 	–	Allow from both Wired and Wireless

Select Management Access to configure restriction of the device from the drop-down list.

Figure 38: The General parameters

Security

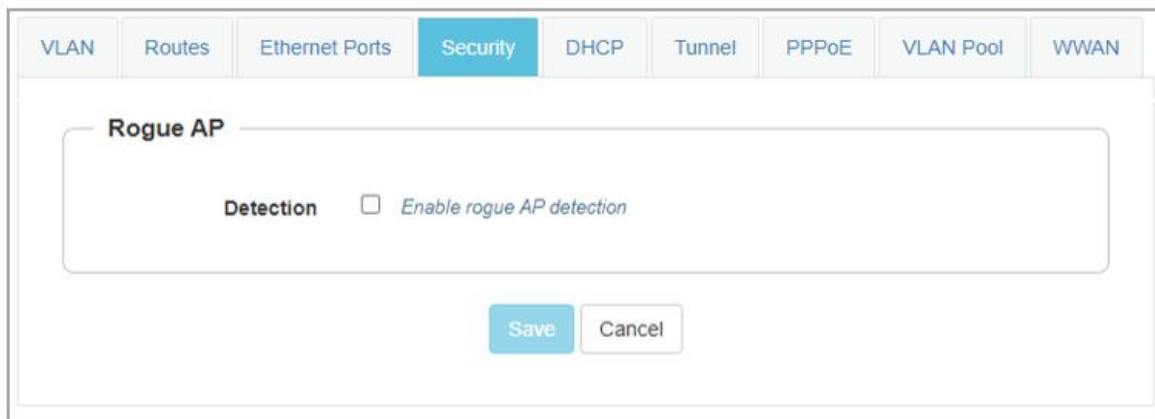

The below table lists the fields that are displayed in the **Configuration > Network > Security** tab.

Table 45: Security parameters

Parameters	Description	Range	Default
Rogue AP			
Detection	Enterprise Wi-Fi devices in association with cnMaestro have the capability of detecting Rogue APs. On enabling this all neighbor information is shared to cnMaestro and reports Rogue APs in the networks.	–	Disabled

To configure the above parameter, navigate to the **Configuration > Network > Security** tab. Select **Detection** check box to enable this functionality.

Figure 39: Security parameters

DHCP

Below table lists the fields that are displayed in the **Configuration > Network > DHCP** tab.

Table 46: DHCP parameters

Parameters	Description	Range	Default
Edit	Provision to select DHCP Pool if multiple Pools are defined on Enterprise Wi-Fi AP device.	–	–
Address Range	Users can configure start and end addresses for a DHCP Pool selected from the drop-down box.	–	–
Default Router	Provision to configure next hop for a DHCP pool selected from the drop-down box.	–	–
Domain Name	Provision to configure the domain name for a DHCP pool selected from the drop-down box.	–	–
DNS Address	Provision to configure DNS server for a DHCP pool selected from the drop-down box.	–	–
Network	Provision to configure Network ID for a DHCP pool selected from the drop-down box.	–	–
Lease	Provision to configure lease for a DHCP pool selected from the drop-down box.	–	–
Add Bind List			
	For every DHCP pool configured, the user can bind MAC and IP from the address pool defined, so that the wireless station gets the same IP address every time they connect. Following parameters are required to bind IP address: <ul style="list-style-type: none">• MAC Address• IP Address	–	–

To configure the above parameter, navigate to the **Configure > Network > DHCP** tab and provide the details as given below:

1. Select DHCP pool from the **Edit** drop-down list.
2. Enter the start and end IP addresses for a DHCP Pool selected from the **Address Range** text box.
3. Enter **Default Router IP** address in the text box.
4. Enter **Domain Name** for a DHCP pool selected in the text box.
5. Enter **DNS Address** for a DHCP pool selected in the text box.
6. Enter **Network ID** for a DHCP pool selected in the text box.
7. Enter **Lease** for a DHCP pool selected in the text box.
8. Click **Save**.

To configure **Add Bind List**, follow the below steps:

1. Enter **MAC Address** for a DHCP pool selected in the text box.
2. Enter **IP Address** for a DHCP pool selected in the text box.
3. Click **Save**.

Tunnel

The following table lists the fields that are displayed in **Configure > Network > Tunnel** tab.

Table 47: The Tunnel parameters

Parameters	Description	Range	Default
Tunnel Encapsulation	Provision to enable tunnel type. Following tunnel types are supported by Enterprise Wi-Fi AP devices: <ul style="list-style-type: none"> • L2TP • L2GRE • OFF 	–	OFF
L2TP			
Remote Host	Configure L2TP end point. IPv4 address or Primary hostname of the endpoint is supported.	–	–
Authentication Info	Provision to configure credentials required for L2TP authentication.	–	–
Auth Type	Provision to select the PPP authentication method. Following are the options available: <ul style="list-style-type: none"> • DEFAULT • CHAP • MS-CHAP • MS-CHAPv2 • PAP 	–	DEFAULT
Secondary Remote Host	Configure secondary L2TP end point. IPv4 address or Secondary hostname of an endpoint is supported.	–	–
Secondary Authentication Info	Provision to configure credentials required for secondary L2TP authentication.	–	–
Secondary Auth Type	Provision to select the secondary PPP authentication method. Following are the options available: <ul style="list-style-type: none"> • DEFAULT • CHAP • MS-CHAP • MS-CHAPv2 • PAP 	–	DEFAULT
TCP MSS	Provision to configure TCP Maximum Segment Size.	422- 1410	1400

Parameters	Description	Range	Default
PMTU Discovery	Provision to enable to discover PMTU in network.	–	Enabled
Disconnect Wireless Clients	Provision to disconnect Wireless Client when the state of L2TP tunnel is down.	–	Enabled
L2GRE-1			
You can configure a maximum of two L2GRE tunnels. Configure L2GRE-1 tunnel by configuring the below parameters in the Configure > Network > Tunnel tab. However, configuring L2GRE-2 tunnel is allowed only using the device CLI. The following parameters for L2GRE-1 are also applicable for L2GRE-2.			
Primary Remote Host	Configure L2GRE endpoint. IPv4 address or Primary hostname of an endpoint is supported.	–	–
Secondary Remote Host	Configure L2GRE endpoint. IPv4 address or Secondary hostname of an endpoint is supported. The tunnel operates in failover mode. After determining the peer is down (no Rx packet received from PEER), AP sends periodic ICMP packet to verify the reachability to the peer before failing over to secondary peer. So ensure ICMP reachability to the tunnel PEER.	–	–
DSCP	Users can configure priority of GRE packets.	–	0
TCP MSS	Provision to configure TCP MSS value.	472-1460	1402
PMTU Discovery	Provision to enable to discover PMTU in a network.	–	–
MTU	Maximum Transmission Unit.	850-1460	1460
GRE in UDP	GRE protocol is designed to establish a tunnel between any third-party vendor which complies with RFC 8086.	–	Disabled
Disconnect Wireless Clients	Provision to disconnect Wireless Client when a state of L2TP tunnel is down.	–	Enabled
Tunnel Reachability	The periodic interval for verifying the RX packet from GRE peer.	30-240	240
Tunnel Retry Attempts	Number of retries before failover to secondary peer.	2-10	5
IPv6 Tunnel	Enables tunnel resolution to send packets through the IPv6 network.	-	Disabled

To configure the above parameter, navigate to the **Configure > Network > Tunnel** tab and provide the details as given below:

1. Select Tunnel type from the **Tunnel Encapsulation** drop-down list.

To configure **L2TP**:

2. Enter IP address or domain name in the **Remote Host** text box.
3. Enter credentials required for L2TP authentication in the **Authentication Info** text box.

4. Select authentication type from the **Auth Type** drop-down list.
5. Enter IP address or domain name in the **Secondary Remote Host** text box.
6. Enter credentials required for secondary L2TP authentication in the **Secondary Authentication Info** text box.
7. Select authentication type from the **Secondary Auth Type** drop-down list.
8. Enter TCP Maximum Segment Size in the **TCP MSS** text box.
9. Enable **PMTU Discovery** check box.
10. Enable **Disconnect Wireless Clients** check box.
11. Click **Save**.

To configure **L2GRE-1**:

12. Enter the IP address or domain name in the **Primary Remote Host/Secondary Remote Host** text box.
13. Enter **DSCP** in the text box.
14. Enter TCP Maximum Segment Size in the **TCP MSS** text box.
15. Enable **PMTU Discovery** check box.
16. Enter Maximum Transmission Unit in the **MTU** text box.
17. Enable GRE in UDP in the **GRE** check box.
18. Enable **Disconnect Wireless Clients** check box.
19. Enter periodic interval value in **Tunnel Reachability** text box.
20. Enter a number of retries in **Tunnel Retry Attempts** text box.
21. Click **Save**.

Configuring **L2GRE-2** tunnel is allowed only using the device CLI. The values of the above parameters are shared across both L2GRE-1 and L2GRE-2 tunnels, except the following:

- Primary Remote Host
- Secondary Remote Host
- IPv6 Tunnel

IPv6 tunnel is configurable only in the device CLI using the `ipv6-tunnel` command.

Execute the `ipv6-tunnel` command in the `config-l2gre-<1/2>` context, as shown in the figure:

Figure 41: ipv6-tunnel command

```
XV2-22H-E53E28(config)# tunnel l2gre 1
XV2-22H-E53E28(config-l2gre-1)# ipv6-tunnel
XV2-22H-E53E28(config-l2gre-1)#
```

[Figure 42](#) displays the parameter differences between L2GRE-1 and L2GRE-2 tunnels.

Figure 42: L2GRE-1 and L2GRE-2 parameters differences

```
XV2-22H-E53E28(config)# tunnel l2gre 1
XV2-22H-E53E28(config-l2gre-1)# remote-host 10.10.10.1
XV2-22H-E53E28(config-l2gre-1)# exit
XV2-22H-E53E28(config)# tunnel l2gre 2
XV2-22H-E53E28(config-l2gre-2)# remote-host 2001:db7::d43:2ee2:26c4:6465
XV2-22H-E53E28(config-l2gre-2)# exit
XV2-22H-E53E28(config)# save
[Config Save OK]
XV2-22H-E53E28(config)#
```

Figure 43: Tunnel parameters

The screenshot shows a network configuration interface with tabs for VLAN, Routes, Ethernet Ports, Security, DHCP, Tunnel, PPPoE, VLAN Pool, and WWAN. The 'Tunnel' tab is active, and 'L2TP' is selected in the 'Tunnel Encapsulation' dropdown.

L2TP Configuration:

- Remote Host:** 0.0.0.0 (IP address or domain)
- Authentication Info:** admin (Max 64 characters)
- Auth Type:** DEFAULT (MS-CHAPv2, MS-CHAP, CHAP, PAP)
- Secondary Remote Host:** 0.0.0.0 (IP address or domain)
- Secondary Authentication Info:** admin (Max 64 characters)
- Secondary Auth Type:** DEFAULT (MS-CHAPv2, MS-CHAP, CHAP, PAP)
- TCP MSS:** 1400 (TCP Maximum Segment Size (422-1410 bytes))
- PMTU Discovery:** (Path MTU Discovery)
- Disconnect Wireless Clients:** (Disconnect Wireless Client when state of L2TP tunnel is down)

L2GRE Configuration:

- Primary Remote Host:** 10.110.211.39 (IP address or domain)
- Secondary Remote Host:** 0.0.0.0 (IP address or domain)
- DSCP:** 0 (Differentiated Service Code Point)
- TCP MSS:** 1402 (TCP Maximum Segment Size (472-1460 bytes))
- PMTU Discovery:** (Path MTU Discovery)
- MTU:** 1460 (Configure MTU for L2GRE tunnel (850-1460 bytes))
- GRE:** GRE in UDP (Enable GRE in UDP encapsulation (RFC 8086))
- Disconnect Wireless Clients:** (Disconnect Wireless Client when state of L2TP tunnel is down)
- Tunnel Reachability:** 240 (Periodic interval for verifying the RX packet from GRE peer (30-240))
- Tunnel Retry Attempts:** 5 (Number of Retries before Fail-Over to Secondary peer (2-10 seconds))

Buttons: Save, Cancel

Point-to-Point Protocol over Ethernet (PPPoE)

PPPoE provides the ability to establish a connection to ISP with user authentication. Below table lists the fields that are displayed in **Configuration > Network > PPPoE** tab.

Table 48: PPPoE parameters

Parameters	Description	Range	Default
Enable	Provision to enable PPPoE client.	–	Disabled
VLAN	Users can configure VLAN ID where PPPoE clients should obtain an IP address.	–	–
Service Name	Configure PPPoE service name	–	–
Authentication Info	Provision to configure credentials required for PPPoE authentication.	–	–
MTU	Maximum Transmission Unit.	500-1492	1430
TCP-MSS Clamping	Configure PPPoE endpoint. Either IP or hostname of an endpoint is supported.	–	Enabled
Management Access	If enabled, the user can access the device either using UI or SSH with PPPoE IP.	–	Disabled

To configure the above parameter, navigate to the **Configure > Network > PPPoE** tab and provide the details as given below:

1. Select **Enable** check box to enable PPPoE functionality.
2. Enter the **VLAN** ID assigned to the PPPoE in the VLAN text box.
3. Enter **Service Name** in the text box.
4. Enter the username and password for the device in the **Authentication Info** text box.
5. Enter the **MTU** value PPPoE connection in the MTU text box.
6. Enable the **TCP-MSS clamping** for the PPPoE connection.
7. Enable **Management Access**.
8. Click **Save**.

TCP MSS Clamping Enable TCP Maximum Segment Size Clamping to avoid packet fragmentation

Management Access Enable CLI/GUI/SNMP access via this interface

VLAN Pool

The following table lists the fields that are displayed in **Configure > Network > VLAN Pool** tab.

Table 49: The VLAN Pool parameters

Parameters	Description	Range	Default
VLAN Pool Name	Provision to configure user-friendly name to a list of VLANs.	–	–
VLAN ID List	List of VLAN IDs for each VLAN Pool name. Users can configure either a single VLAN ID or multiple VLAN IDs. Multiple VLAN IDs can be configured either separated by comma or hyphen.	–	–

To configure the above parameter, navigate to the **Configure > Network > VLAN Pool** tab and provide the details as given below:

1. Enter the name of the VLAN pool in the **VLAN Pool Name** text box.
2. Enter the VLAN ID in the **VLAN ID List** text box.
3. Click **Save**.

Figure 45: The VLAN Pool parameters

The screenshot displays the configuration page for a VLAN Pool. At the top, there is a navigation menu with tabs for VLAN, Routes, Ethernet Ports, Security, DHCP, Tunnel, PPPoE, VLAN Pool (selected), and WWAN. The main configuration area contains the following elements:

- VLAN Pool Name:** An empty text input field.
- VLAN ID List:** A text input field containing the value "1-4094".
- Table:** A table with three columns: "VLAN Pool Name", "VLAN ID List", and "Act...". It contains one entry: "pool1" with "1,20" in the second column and a trash icon in the third.
- Footer:** A status bar showing "1_ 1 of 1 items", navigation arrows, a page number "1", a search icon, and a dropdown menu set to "10 items per page".
- Buttons:** "Save" and "Cancel" buttons are located at the bottom center.

Wireless Wide Area Network (WWAN)

The following table lists the fields that are displayed in **Configure > Network > WWAN** tab.

Note

This feature is supported in XV2-2, XV3-8, XE3-4, and XE5-8 platforms only.

Table 50: WWAN parameters

Parameters	Description	Range	Default
WWAN	Provision to enable wireless WAN using a USB cellular dongle for internet access.	–	–
Failover Only	Failover only can be configured in two modes: <ul style="list-style-type: none">• Enabled: Ethernet will be the primary connection and WWAN will be backup.• Disabled: 3G/4G (WWAN) will be the only working connection. Note: Cellular link can be configured as backup only to Ethernet connection.	–	Enabled
APN	Provision to configure network provider APN address.	–	–
Authentication	Provision to configure credentials required for WWAN authentication.	–	–
Monitor Host	Running a check in the background that constantly monitors a user configured IP address (example: 8.8.8.8) for reachability through ping.	–	–

To configure the above parameter, login to cnMaestro **AP Group > Network > WWAN** tab and provide the details as given below:

1. Enable **WWAN** check box to enable this functionality.
2. Check/Uncheck **Failover Only** to enable/disable.
3. Enter the **APN** address in the text box.
4. Enter the **Authentication** credentials.
5. Enter any IPv4 address to **Monitor Hoist** text box.
6. Click **Save**.

Figure 46: WWAN parameters

The screenshot shows a web-based configuration interface for an AP Group named 'Ent_Mesh_ZeroTouch_APGrp'. The 'Configuration' tab is active, and the 'Network' section is selected in the left-hand navigation menu. The main content area displays several configuration options: 'DHCP Pool', 'Tunnels', 'PPPoE', and 'VLAN Pool', each with a plus sign icon. The 'WWAN' section is expanded, showing a checkbox for 'Enable Wireless WAN using a USB cellular dongle for internet access' which is currently unchecked. Below this, the 'Failover Only' section has a checked checkbox for 'Use WWAN as backhaul only when failover is triggered'. The 'APN' field is empty, with a label 'Configure network provider APN address'. The 'Authentication Info' section includes 'Username' and 'Password' fields, with a 'Show' button next to the password field. The 'Monitor Host' field is empty, with a label 'Host to monitor in order to trigger WWAN failover'. A 'Save' button is located at the bottom of the configuration area.

Supported hardware

Cambium Networks currently support following models:

- Huawei
 - E8372
 - E3372
- Alcatel
 - Link Key 4G IK40V
- ZTE
 - MF833V

Chapter 8: Managing Filters

This chapter describes the following topics:

- [Overview](#)
- [Filter list](#)
- [Filters](#)
- [Application control](#) Premium feature

Overview

Filters are used to define the rules used for blocking or passing traffic and also to change QoS/DSCP and rate-limiting for selected traffic.

The Wireless AP's integrated firewall uses stateful inspection to accelerate the decision of whether to allow or deny traffic user connections managed by the firewall are maintained statefully. Once user flow is established through the AP, it is recognized and passes through without the application of all defined filtering rules. Stateful inspection runs automatically on the AP.

Filter list

Filters are organized in groups, called filter lists. A filter list allows users to apply a uniform set of filters to SSIDs. AP supports 16 filter lists and each filter list supports 50 filter rules in precedence order.

Filters

These settings create and manage filters with precedence that belong to the current filter list, based on the filter criteria you specify.

Filters can be configured in Layer 2 and Layer 3 or application/category control (Layer 7). Layer 2 rule takes high precedence over Layer 3 application control and Layer 2 supports MAC/IP/protocol-based rules.

Filters are an especially powerful feature when combined with the intelligence provided by the **Application Control Windows**.

Based on Application Control's analysis of your wireless traffic, you can create filters to enhance wireless usage for your business needs:

1. Usage of non-productive and risky applications like BitTorrent can be restricted.
2. Traffic for mission-critical applications like VoIP and WebEx may be given higher priority (QoS).
3. Non critical traffic from applications like YouTube may be given lower priority (QoS) or bandwidth allowed may be capped per station or for all stations.

Configuring filter CLI

By configuring the filter CLI, the user can define ACL rules for blocking or passing traffic, DSCP/QoS rules for modifying packets, and rate-limiting for selected traffic.

1. Create filter list/filter profile using global filter command (Filter: configure filter parameters).

```
XV3-8-EC7708(config)# filter
```

```
filter-list : Configure filter list
global-filter : Configure Global filter parameters
```

2. Global-filter is for global rules in AP. Global-filter includes the below options:

```
XV3-8-EC7708(config-global-filter)#
air-cleaner : Configure Preset air cleaner filters
application-control : Enable application control
clear : Clear command
disable : Disable filter list
filter : Configure filter rules in precedence order
stateful : Enable stateful filtering
apply : Apply configuration that has just been set
exit : Exit from filter list configuration
no : Delete/disable filter list parameters
save : Save configuration to Flash so it persists across reboots
show : Show command
```

- **Stateful filtering** : Stateful operation of the integrated firewall can be Enabled or Disabled. By default, it is enabled.
- **Application Control** [Premium feature](#): Operation of the Application Control feature may be Enabled or Disabled.
- **Disable**: Disable or enable filter list.

3. Each filter list includes below options:

```
clear          : Clear command
disable       : Disable filter list
filter        : Configure filter rules in precedence order
name         : Name of filter list

apply        : Apply configuration that has just been set
exit         : Exit from filter list configuration
no          : Delete/disable filter list parameters
save        : Save configuration to Flash so it persists across reboots
show        : Show command
```

Note

Global-filter rules will take precedence over filter-list rules

- Global filter and filter-list can include 50 filter rules with precedence order.

```
XV3-8-E78A88(config-filter-list-1)# filter precedence {1-50}
```

4. Then create filter rule from precedence level (1 to 50).

```
XV3-8-EC7708(config-list-1-filter-precedence-1)# exit
XV3-8-EC7708(config-filter-list-1)# filter precedence 1
XV3-8-EC7708(config-list-1-filter-precedence-1)#

application-control : Configure application control filters
category-control   : Configure application category control filters
clear               : Clear command
disable             : Disable filter
layer2-filter       : Configure Layer2 filter
layer3-filter       : Configure Layer3 filter
logging             : Enable filter logging
rate-limit          : Set traffic limit for this filter
schedule            : Schedule Layer3 rules
wlan-to-wlan        : Restrict 'in' direction rule's egress direction as wlan

apply              : Apply configuration that has just been set
exit                : Exit from custom filter configuration
no                  : Disable the filter options
save                : Save configuration to Flash so it persists across reboots
show                : Show command
```

Note

The filter type is either Layer 2 or Layer 3 or application control can be added in one precedence level.

5. Layer 3 filter has the below provisions.

```
XV3-8-EC7708(config-list-1-filter-precedence-1)# layer3-filter

deny                : Drop packet matching the rule
permit              : Allow packet matching the rule
set-dscp             : Set DSCP value to packet matching the rule
set-qos              : Set QoS value (0-3) to packet matching the rule
```

- **QoS [Premium feature](#)**: Set packets QoS level (0 to 3). Level 0 has the lowest priority; level 3 has the highest priority
- **DSCP [Premium feature](#)**: Differentiated Services Code Point or DiffServ (DSCP). DSCP level (0 to 63). Level 0 has the lowest priority and level 63 has the highest priority.
- **Rate limit [Premium feature](#)**: Filters support rate limiting per station or all stations and support Kbps/Mbps/pps.
- **Schedule [Premium feature](#)**: Filter support scheduling the activation of the layer3 /application control rules based on the day and local time selected.
- **Disable**: Each filter and filter list can be turned on/off.

Note:

Application Control, QoS, DSCP, Schedule and Rate limit are [Premium features](#).

6. Each layer 3 rule category has below types

```
XV3-8-EC7708(config-list-1-filter-precedence-1)# layer3-filter set-dscp

ip                  : IPV4 address based rule
ip6                  : IPV6 address based rule
proto                : Protocol based rule
proto6               : IPv6 Protocol based rule
```

7. For proto or port number-based rule, select proto.

```
XV3-8-EC7708(config-list-1-filter-precedence-1)# layer3-filter set-dscp proto
layer3-filter set-dscp proto (tcp|udp|icmp|igmp|srp|sctp|any) (SOURCE-IP/{mask|prefix-length}}|any) (SOURCE-PORT|any) (DESTINATION-IP/{mask|prefix-length}}|any) (DESTINATION-PORT|any) (in|out|any) (DSCP{0-63}) <(optional)//Filter_name>
```

Note

All fields are mandatory. If no parameter to configure, give 'any'. Direction is the direction of the rule. If it is 'in', the rule is applicable for traffic from the wireless side. If it is 'out', the rule is applies for traffic to wireless.

8. For non-proto or port number-based rules, select IP.

```
XV3-8-EC7708(config-list-1-filter-precedence-1)# layer3-filter set-dscp ip
layer3-filter set-dscp ip (SOURCE-IP/{mask|prefix-length}}|any) (DESTINATION-IP/{mask|prefix-length}}|any) (in|out|any) (DSCP{0-63}) <(optional)//Filter_name>
```

9. Layer 2 filter has below options:

```
XV3-8-EC7708(config-list-1-filter-precedence-11)# layer2-filter
deny          : Drop packet matching the rule
permit       : Allow packet matching the rule
```

10. Each layer 2 rule category has below two cases.

```
XV3-8-EC7708(config-list-1-filter-precedence-11)# layer2-filter permit
mac          : Mac or IP based Rule with out Protocol
proto       : Mac or IP based rule with Protocol
```

Layer 2 rule supports IP, MAC, Port, or Protocol-based rules.

11. XV3-8-E78A88 (config-list-1-filter-precedence-1) # layer2-filter permit mac.

```
XV3-8-EC7708(config-list-1-filter-precedence-1)# layer2-filter permit mac
layer2-filter permit mac (SOURCE-MAC/IPv4/IPv6{(optional)//(mask|prefix-length}}|any) (DESTINATION-MAC/IPv4/IPv6{(optional)//(mask|prefix-length}}|any) (in|out|any) <(optional)//Filter_name>
```

Example:

```
e.g. layer2-filter permit mac 00-01-02-03-04-05 00-01-02-09-08-07 any //filter to allow_guest
'!' for not e.g. layer2-filter permit mac 00-01-02-03-04-05 !00-01-02-09-08-07 out
layer2-filter permit mac !1.1.1/8 any any
```

12. XV3-8-E78A88 (config-list-1-filter-precedence-1) # layer2-filter permit proto

```
XV3-8-EC7708(config-list-1-filter-precedence-1)# layer2-filter permit proto
layer2-filter permit proto (tcp|udp|arp|icmp|igmp|srp|sctp|any) (SOURCE-MAC/IPv4/IPv6/{
[mask|prefix-length]}|any) (SOURCE-PORT|any) (DESTINATION-MAC/IPv4/IPv6/{[mask|prefix-len
gth]}|any) (DESTINATION-PORT|any) (in|out|any) <(optional)//Filter_name>
```

Example:

```
e.g layer2-filter permit proto tcp any any any 10000 any //filter_permit_guest
'!' for not e.g layer2-filter permit proto tcp any any !00-00-11-11-11-11 10000 out
layer2-filter permit proto tcp 1.1.1.1 1000 00:11:22:33:44:44/ff-ff-ff-00-00-00 5000 any
```

Sample configuration

```
filter global-filter
stateful
application-control

filter filter-list 1
filter precedence 1
layer3-filter set-qos ip any 9.9.9.9 in 2
rate-limit all Mbps 500
exit
filter precedence 2
layer3-filter deny ip 5.5.5.5 6.6.6.6 any
exit
filter precedence 3
layer3-filter permit ip any any any
exit
filter precedence 4
layer3-filter permit ip 9.9.9.9 any any
exit
```

13. To attach the filter list into the WLAN profile, filter-list < filter-list ID>.

```
wireless wlan 1
ssid cambium-guest
no shutdown
vlan 1
filter-list 1
```

14. To show filter statistics:

```
XV3-8-441BCC(config)# show filter-statistics

Filter ID | global
```

Device class filter

This feature applies wireless policies to the client-based device class (notebook, phone, tablet, and laptop) and its type (Windows, Mac, and Android).

CLI configuration:

```
XV3-8-EC7708(config)# device-class-filter 1
```

```

XV3-8-EC7708(config-device-class-filter-1)# class
ap : Configure filter rules for the AP device class
appliance : Configure filter rules for the appliance device class
desktop : Configure filter rules for the desktop device class
game : Configure filter rules for the game device class
notebook : Configure filter rules for the notebook device class
phone : Configure filter rules for the phone device class
player : Configure filter rules for the player device class
tablet : Configure filter rules for the tablet device class
XV3-8-EC7708(config-device-class-filter-1)# class notebook
all : Configure filter rules for all notebook device classes
chrome : Configure filter rules for the Chrome-OS device type
linux : Configure filter rules for the Linux device type
mac : Configure filter rules for the Mac device type
windows : Configure filter rules for the Windows device type
XV3-8-EC7708(config-device-class-filter-1)# class notebook linux
XV3-8-EC7708(config-device-class-filter-1)# filter-list
Filter list ID <1-16> or Name

```

Wi-Fi Calling support

Cambium Networks Access Point has the inbuilt application visibility engine, which can detect Wi-Fi calling and provide better call quality by reducing the latency, jitter, and roaming delays for voice calls over Wi-Fi.

When the Access Point detects the Wi-Fi calling traffic, it classifies and puts the traffic in the voice priority queue for achieving better call quality.

CLI configuration:

```

filter precedence 5
application-control wificall set-qos 3

```

Note

Filter precedence can be from 1 to 50.

Air cleaner

The Air Cleaner feature offers several predetermined filter rules that eliminate a great deal of unnecessary wireless traffic.

Configuration CLI:

```

XV3-8-EC7708(config)# filter global-filter
XV3-8-EC7708(config-global-filter)# air-cleaner
all : All air cleaner filters

```

arp : Eliminate station to station ARPs over the air
broadcast : Eliminate broadcast traffic from the air
dhcp : Eliminate stations serving DHCP addresses from the air
multicast : Eliminate chatty multicast traffic from the air

When we configure the Air Cleaner rule, pre-defined filter rules will get populated automatically as shown below:

```
XV3-8-EC7708(config-global-filter)# air-cleaner all
XV3-8-EC7708(config-global-filter)# show config filter
!
!
filter global-filter
stateful
application-control
air-cleaner all
filter precedence 1
layer2-filter deny proto arp any any in //Air-cleaner-Arp.1
wlan-to-wlan
exit
filter precedence 2
layer2-filter deny proto udp any any FF:FF:FF:FF:FF:FF 67 out //Air-cleaner-Dhcp.1
exit
filter precedence 3
layer2-filter deny proto udp any any FF:FF:FF:FF:FF:FF 68 in //Air-cleaner-Dhcp.2
exit
filter precedence 4
layer2-filter permit proto arp any FF:FF:FF:FF:FF:FF any //Air-cleaner-Bcast.1
exit
filter precedence 5
layer2-filter permit proto udp any any FF:FF:FF:FF:FF:FF 67 any //Air-cleaner-Bcast.2
exit
filter precedence 6
layer2-filter permit proto udp any any FF:FF:FF:FF:FF:FF 68 any //Air-cleaner-Bcast.3
exit
filter precedence 7
layer2-filter permit proto udp any any FF:FF:FF:FF:FF:FF 22610 any //Air-cleaner-
Bcast.4
exit
filter precedence 8
```

```
layer2-filter deny mac any FF:FF:FF:FF:FF:FF any //Air-cleaner-Bcast.5
exit
filter precedence 9
layer2-filter permit mac any 01:00:5E:00:00:FB any //Air-cleaner-mDNS.1
exit
filter precedence 10
layer2-filter deny mac any multicast any //Air-cleaner-Mcast.1
exit
```

Note

In Mesh link configuration, the Air Cleaner rules need customization like disabling Precedence 2 and Precedence 3 (DHCP rules).

Application control [Premium feature](#)

The Application Control feature provides real-time visibility of application usage by users across the wireless network. Network usage has changed enormously in the last few years, with the increase in smartphone and tablet usage stressing networks. Increasing traffic from legitimate business needs such as cloud- and web-based applications, streaming media, and VoIP must be handled with an adequate quality of experience. To achieve this purpose Application Control filters are used to define the rules used for blocking or passing and change QoS/DSCP and rate-limiting for the specific Application or a specific category of application. For more details, refer to the Application Control Filters section in the user guide

Application Control can track application usage over time to monitor trends. Usage may be tracked by AP, VLAN, or station. Many hundreds of applications are recognized and grouped into a number of categories. The distributed architecture of Cambium Enterprise APs allows Application Control to scale naturally as you grow the network.

Deep Packet Inspection (DPI)

The AP uses Deep Packet Inspection (DPI) to determine what applications are being used and by whom, and how much bandwidth they are consuming. These applications are rated by their degree of risk and productiveness. [Filters](#) can be used to implement per-application policies that keep network usage focused on productive uses.

Application control policy

When you find risky or unproductive applications consuming bandwidth on the network, you can easily create [Filters](#) to control them. You may use filters to:

- Block problematic traffic, such as BitTorrent or Y8.
- Prioritize mission-critical traffic: By increasing the QoS assigned to the traffic, applications like VoIP and WebEx may be given higher priority (QoS).
- Lower the priority of less productive traffic: Use filters to decrease the QoS assigned to traffic for applications like YouTube and Facebook.
- A nonproductive specific application can be rate-limited to avoid impact on the productive application. (for example, YouTube streaming can be rate-limited to avoid impact on applications like VoIP)

Risk and productivity

Application control ranks applications in terms of their levels of risk and productivity.

Productivity: Indicates how appropriate an application is useful for business purposes. The higher the rating number, the more business-oriented an application is:

1. Primarily recreational
2. Mostly recreational
3. Combination of business and recreational purposes
4. Mainly used for business
5. Primarily used for business

Risk: indicates how likely an application is to pose a threat to the security of your network. The higher the rating number, the riskier of an application is:

1. No threat
2. Minimal threat
3. Some risk: maybe misused
4. High risk: maybe malware or allow data leaks
5. Very high risk: threat circumvents firewalls or avoids detection

Selection criteria

From the AP CLI, the below options are available to view the Application Statistics:

- **Application:** This gives detailed information about the application seen from the wireless traffic.
- **Category:** This gives the combined statistics of the application which belongs to a particular category (for example, Games, Network monitor).

```
XV3-8-441BCC(config)# show application-statistics by-application
Applications Count = 24

- **Time frame:** This gives information about the application seen in last the duration (for example, 1 day).
 - For low-risk numbers, the productivity is high and vice versa. (example, for GitHub (shown in the below figure) the risk index number is 1 and the productive index is 4, this means the application is low risk and more productive).

```

DPI CLI configuration

Users can enable Application Control globally by using the below commands:

To enable DPI support:

```
XV3-8-EC7708(config)# filter global-filter
XV3-8-EC7708(config-global-filter)# application-control
XV3-8-EC7708(config-global-filter)#
```

To disable DPI support:

```
XV3-8-EC7708(config)# filter global-filter
XV3-8-EC7708(config-global-filter)# no application-control
XV3-8-EC7708(config-global-filter)#
```

Global application policy

Per application policy

```
XV3-8-441BCC(config)# filter global-filter
XV3-8-441BCC(config-global-filter)# filter precedence 1
XV3-8-441BCC(config-global-filter-precedence-1)# application-control

Chapter 9: Wireless Intrusion Detection Systems (WIDS) Premium feature

Wireless flood detection

A flood attack happens when a rogue client sends a huge number of packets of a specific type to the AP to disrupt the normal working of the AP. This feature can detect the following five types of flood attacks:

- Association
- Authentication
- Disassociation
- Deauthentication
- Extensible Authentication Protocol over LAN (EAPoL)

CLI configuration:

```
XV3-8-EC7708(config)# wids
association-flood : Detect floods of client associations from clients
authentication-flood : Detect floods of client authentication from clients
deauthentication-flood : Detect floods of clients deauthentications from clients
disassociation-flood : Detect floods of client disassociations from clients
eap-flood : Detect floods of EAP messages from clients
num-of-minutes : Configure time duration for flood detection
num-of-packets : Configure threshold of flood packets
```

Neighbour/Rogue AP detection

The AP can detect all neighbour APs and Rogue APs. To enable Neighbour/Rogue AP detection, refer to [Security](#) section.

By default, all Neighbours/Rogue APs in the home channel are detected. To detect Neighbours/Rogue APs in all channels, go to **Radio > Basic > Off Channel Scan** and click **Enable** checkbox.

Note

Off Channel Scan is not required for XV3-8 platforms because they have inbuilt Radio for monitoring.

Ad Hoc network detection

A wireless Ad Hoc network is a type of Local Area Network (LAN) that is built spontaneously to enable two or more wireless devices to be connected to each other without requiring typical network infrastructure equipment, such as a wireless router or AP.

CLI configuration:

To enable Ad Hoc network detection

```
XV3-8-EC7708(config)# wids
```

```
ad-hoc-detection : Detect ad-hoc networks
```

To display Ad Hoc networks

```
XV3-8-EC7708(config)# show wireless adhoc-networks
```

Chapter 10: Configuring Services

This chapter describes the following topics:

- [Overview](#)
- [Configuring services](#)

Overview

This chapter gives an overview of Enterprise Wi-Fi AP configurable parameters related to User Groups, Location API, Speed Test, BT Location API, Bonjour Gateway, LACP, and RTLS.

Configuring services

This section provides information on how to configure the following services on Enterprise Wi-Fi AP.

- [User Groups](#)
- [Location API](#)
- [Speed Test](#)
- [DHCP Option 82](#)
- [BT Location API](#)
- [Bonjour Gateway](#)
- [Link Aggregation Control Protocol \(LACP\)](#)
- [Real-Time Location System \(RTLS\)](#)

User Groups [Premium feature](#)

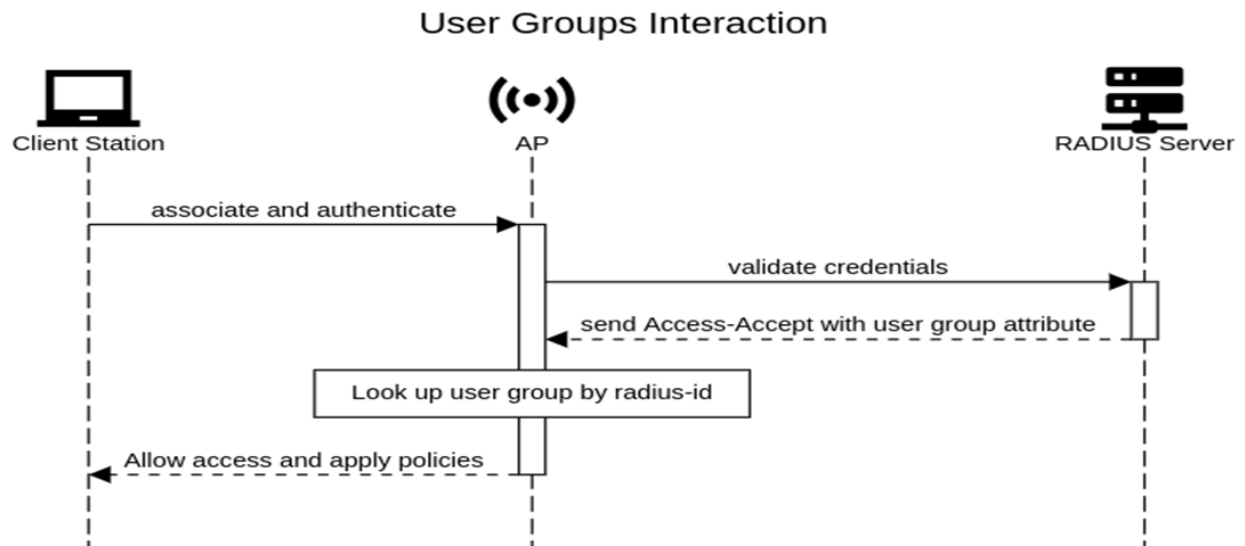

Some policies, like VLAN, require many RADIUS attributes to be sent by the RADIUS server and processed by the AP. Some wireless network administrators do not have administrative access to the RADIUS server, so making changes to wireless policies would require waiting for the RADIUS administrator to make changes.

To simplify wireless administration and streamline changes, a feature called User Groups is provided that allows the wireless administrator to apply a set of wireless policies to a user based on a single RADIUS attribute. This eliminates the need for administrative rights on the RADIUS server and simplifies applying complex policies to end-user stations.

A user group can also be assigned to a station based on the device type. This approach is dependent on the accuracy and completeness of device identification functionality, which is not guaranteed to be accurate or exhaustive.

The User Group feature is natively supported by XMS Cloud.

Figure 47: User Groups interaction

CLI Configuration:

```
XV3-8-EC7708(config)# group
Specify user group number <1-16>
XV3-8-EC7708(config)# group 1
XV3-8-EC7708(config-group-1)#
clear : Clear command
filter-list : Filter list selection for this user group
radius-id : Radius Filter-ID (Attribute Type 11) mapped to this user group
shutdown : Disable the user group
vlan : Set the vlan id for client traffic on this user group
apply : Apply configuration that has just been set
exit : Exit from user group configuration
no : Disable user group parameters
save : Save configuration to Flash so it persists across reboots
show : Show command
XV3-8-EC7708(config-group-1)#
```

Example:

```

!
group 1
 radius-id student
 vlan 40
 filter-list 1
!
group 2
 radius-id teacher
 vlan 30
 filter-list 2
!

```

User group properties and actions

A user group supports the following properties and actions:

Command	Description
shutdown	Disable this User Group
radius-id	Radius Filter-ID (Attribute Type 11) mapped to this User Group
no shutdown	Enable this User Group
no group <index>	Delete User Group

User group policies

The policies available in a user group configuration are a subset of those for an SSID. The most commonly used policies are filter-list and VLAN.

Policy	Description
filter-list <index>	Filter List setting for this User Group
vlan	VLAN associated with this User Group

Location API

Location API is a method to send the discovered (Probed) clients list to a specified server address. The reports are sent as HTTP Post to the HTTP server every interval. The discovered client entries are deleted from the list if the entry is aged out. The client aging timeout is 2 times of location API interval configured. If there are no new probe requests from the client within 2 x location API interval time, then the client entry will be removed from the list.

Below table lists the fields that are displayed in the **Configuration > Services > Location API** tab.

Table 51: Location API parameters

Parameters	Description	Range	Default
Enable	Provision to enable/disable Location API services.	-	-
Server	Provision to configure HTTP/HTTPS server to send a report with the pot number.	0-65535	-

Parameters	Description	Range	Default
Interval	Provision to configure the custom frequency of information to be shared on server.	2-3600	-
MAC Anonymization	Avoid populating locally administrated MAC addresses in the Location API client list.	-	-

To configure the above parameter, navigate to the **Configure > Services > Location API** tab and provide the details as given below:

1. Select the **Enable** checkbox to enable Location API.
2. Enter the HTTP/HTTPS server and port number in the **Server** textbox.
3. Enter the interval for Location API in the **Interval** textbox.
4. Enable **MAC Anonymization** checkbox.
5. Click **Save**.

Figure 48: Location API parameters

Location API

Enable

Server
Configure HTTP/HTTPS server with the port number (0-65535)

Interval
Configure Location API interval (2-3600) seconds

MAC Anonymization *Ignore Anonymized MACs* ⓘ

Note

For further details about this feature and sample reference output, go to <https://support.cambiumnetworks.com/files/cnpilot-tech-ref/> and download **Wireless client Presence and Locating API** document.

Speed Test

Wifiperf is a speed test service available on Enterprise Wi-Fi AP devices. This tool is interoperable with open source zapwireless tool (<https://code.google.com/archive/p/zapwireless/>).

The wifiperf speed test can be triggered by using zapwireless tool between two Enterprise Wi-Fi APs or between Enterprise Wi-Fi APs and other third-party devices (or PC) that is having zapwireless endpoint running.

Refer to <https://code.google.com/archive/p/zapwireless/> to download the zap wireless tool to generate zapwireless endpoint for third party device (or PC) and zap CLI to perform the test.

In this case, wifiperf endpoint should be enabled in Enterprise Wi-Fi AP through UI shown below.

Table 52 lists the fields that are displayed in the **Configuration > Services > Speed Test** tab.

Table 52: Speed Test parameters

Parameters	Description	Range	Default
wifiperf	Provision to enable wifiperf functionality.	–	Disabled

To configure the above parameter, navigate to the **Configure > Services > Speed Test** tab. Select **Wifiperf** checkbox to enable this functionality.

Figure 49: Speed Test parameters

DHCP Option-82

DHCP Option 82 parameter enabled at the device level with VLAN IDs inserts the Option 82 parameters in all the DHCP client packets leaving the configured VLAN interfaces. This device-level configuration precedes the DHCP Option 82 configuration at the WLAN profile or the L3 interface levels.

In case DHCP Option 82 is configured at the device-, WLAN profile-, and L3 interface-levels, the following priority order is considered:

1. Device-level configuration
2. WLAN profile-level configuration
3. L3 interface-level configuration

The device-level configuration is recommended when it is desired to insert the DHCP Option 82 for the following options:

- Guest access enabled wired traffic
- Guest and without guest access enabled wireless DHCP client traffic

To configure the above parameter, navigate to the **Configure > Services > Network** tab and provide the details in the **DHCP Option 82** section:

1. Select the **Enable** checkbox.
2. Select the circuit ID from the **Option 82 Circuit ID** drop-down list.

Following are the supported values:

- **None**
- **All**
- **Hostname**
- **APMAC**

- SSID
- VLANID
- SITEID
- Custom

3. Select the remote ID from the **Option 82 Remote ID** drop-down list.

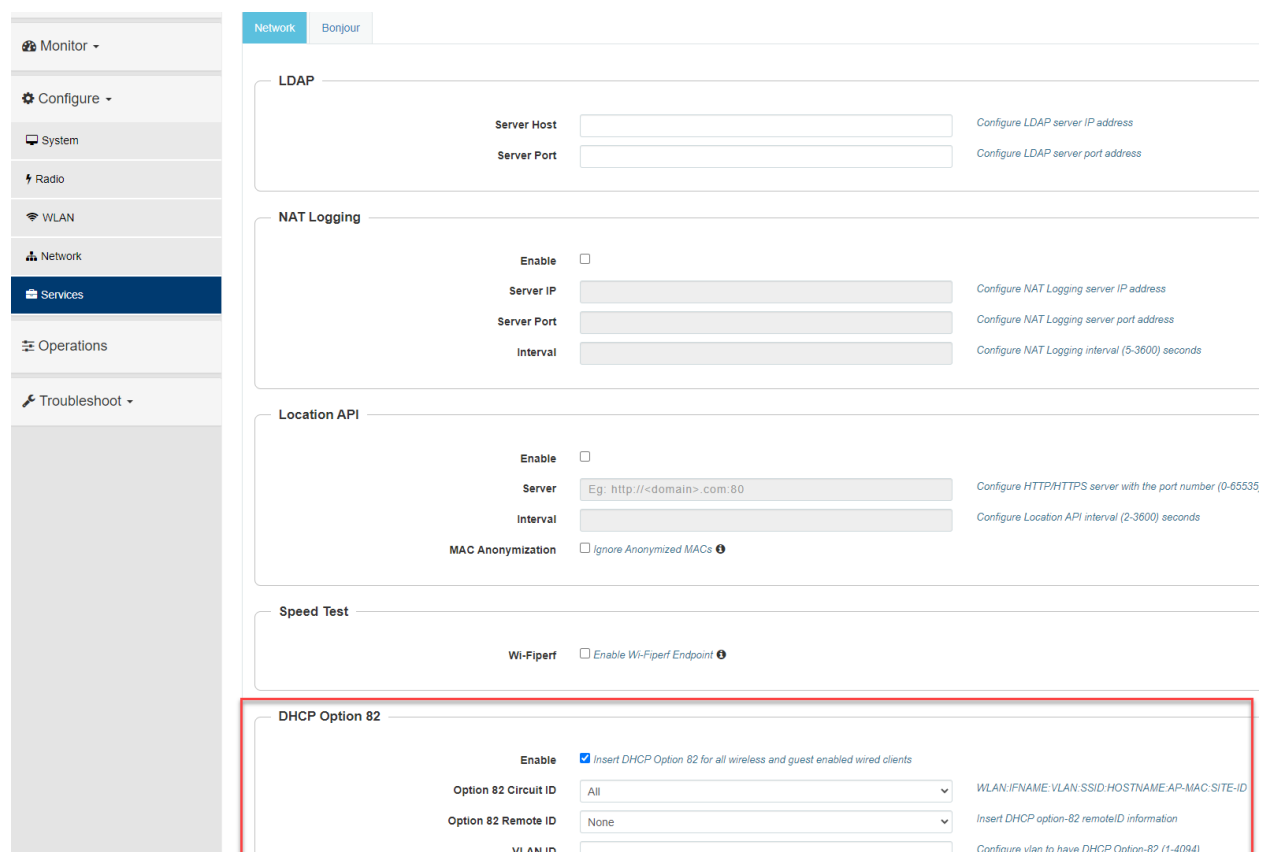

Following are the supported values:

- None
- Hostname
- APMAC
- SSID
- VLANID
- SITEID
- Custom

4. Enter the VLAN ID in the **VLAN ID** text box.

5. Click **Save**.

Figure 50: DHCP Option 82 parameter

BT location API

XV3-8/XV2-2T APs with an integrated Bluetooth Low Energy (BLE) radio can detect and locate nearby BLE devices. This data is then provided via API to third-party applications. Examples of such devices include smartwatches, battery-based beacons, Apple iBeacons, fitness monitors, and remote sensors.

Organizations can create use cases for indoor wayfinding and mapping, asset tracking, and more.

Below table lists the fields that are required for configuring BT Location API.

Table 53: BT Location API parameters

Parameters	Description	Range	Default
Location-bt-api server	Provision to configure details of the destined API server.	-	-
Location-bt-api interval	Provision to configure the interval at which the BT information is updated to the destined API server.	2-3600	2
Ignore-anonymized-bt-mac	Ignore client BT addresses that are anonymized.	-	-

Sending report

After enabling BLE Scanning on AP it will start processing:

1. Convert the scanned data to a JSON array.
2. Send that data in one single HTTP/HTTPS POST.

To configure the BT Location-API in the CLI:

```
XV3-8-EC7708(config)# location-api
ignore-anonymized-mac : Ignore MAC addresses that are anonymized
interval : Configure reporting interval in secs
server : HTTP/HTTPS server to send report to with the port number
```

To disable the BT Location-API:

```
XV3-8-EC7708(config)# no location-bt-api
```

BT Location API data elements

Table 54: BT Location API data elements

Parameters	Description
apMac	MAC address of the observing AP.
API Version	API Version applied for particular data format.
AP Name	Host name of the observing AP.
Timestamp	Observation time in seconds seen by AP.
BT MAC	BLE device MAC seen by AP.
UUID	BLE device UUID seen by AP.
RSSI	BLE device RSSI as seen by AP.

HTTP POST body format:

```
{
  'ap_mac': '00-04-56-A5-5A-EC',
  'version': '2.2',
  'ap_name': 'XV3-8-EC7708',
  'ble_discoverd_clients': {Array of 0-250 devices}
}
```

Bluetooth API Data Format

```
{
  'bt_rssi': ' -80 dBm ',
  'bt_mac': '14-8F-21-FD-37-18',
  'bt_uuids': 'Garmin International, Inc. (0xfelf)\n',
  'bt_timestamp': '1.811127'
}
```

Bonjour Gateway

Bonjour enables the automatic discovery of devices such as printers, file servers, and other clients and services on a local network. Bonjour Gateway feature on Wi-Fi AP extends the scope of Bonjour service beyond the local network by forwarding Bonjour Multicast DNS (mDNS) packet across different VLANs, to make Bonjour services/devices available between the different wireless/local networks.

Below table lists the fields that are displayed in the **Configuration > Services > Bonjour** tab.

Table 55: Bonjour Gateway parameters

Parameters	Description	Range	Default
Enable	Provision to enable/disable Bonjour Gateway services.	-	-
Service Name	Provision for user-defined Bonjour rule name.	-	-
Proto	Select the required mDNS protocol.	-	-
From VLAN	VLAN in which mDNS/Bonjour service is running.	-	-
To VLAN	VLAN in which clients are listening.	-	-

To configure the above parameter, navigate to the **Configure > Services > Bonjour** tab and provide the details as given below:

1. Select the **Enable** checkbox to enable Bonjour Gateway.
2. Enter the **Service Name** in the textbox.
3. Select **Proto** type from the drop-down list.
4. Select **From VLAN** and **To VLAN** from the drop-down list.
5. Click **Save**.

Figure 51: Bonjour parameter

The screenshot displays the configuration page for the Bonjour Gateway. It features a navigation bar with 'Network' and 'Bonjour' tabs. The main content area includes an 'Enable' section with an unchecked checkbox for 'Enable Bonjour Gateway'. Below this are four input fields: 'Service Name', 'Proto' (set to 'AirPrint'), 'From VLAN', and 'To VLAN'. A 'Save' button is positioned to the right of the 'To VLAN' field. At the bottom, a pagination control shows '1 / 1' items and '10 items per page'.

CLI Configuration:

1. Enable Bonjour Gateway on AP.

```
XV3-8-EC7708(config)# bonjour-gw
```

2. To configure Bonjour rule.

```
XV3-8-EC7708(config)# bonjour-fw rules
bonjour-fw rules <sname> <proto> <vidfrom> <vidto>
```

3. To control mDNS repeated packet to WAN side.

```
XV3-8-EC7708(config)# bonjour-fw bonjour-forward-to-wan
all : Forward all bonjour mdns packets queries and response repeated with vlan to
WAN side
queries : Forward bonjour mdns Query packets repeated with vlan to WAN side
responses : Forward bonjour mdns Response packets repeated with vlan to WAN side
```

Note

1. By default, mDNS repeated will not send to the WAN side.
2. WAN side indicates Eth 1 interface, Mesh client interface in case of mesh client mode, tunnel interfaces like L2GRE, and L2TP.

Link Aggregation Control Protocol (LACP)

LACP provides the ability to group multiple physical ports as a logical port. This logical port is referred to as port-channel and supported only on XV3-8 devices. LACP is a dynamic protocol used to form and maintain the Link aggregation between two LACP supported devices.

LACP provides the following benefits:

- Increased Bandwidth: traffic may be balanced across the member ports to provide increased aggregate throughput.
- Link redundancy: the LACP bundle can survive the loss of one or more member links.

Configuration:

To add Ethernet to port channels:

```
XV3-8-EC7708(config)# interface portchannel 1
XV3-8-EC7708(config-portchannel-1)# exit
XV3-8-EC7708(config)# interface eth 1
XV3-8-EC7708(config-eth-1)# channel-group 1
XV3-8-EC7708(config-eth-1)# exit
XV3-8-EC7708(config)# interface eth 2
XV3-8-EC7708(config-eth-2)# channel-group 1
XV3-8-EC7708(config-eth-2)#
```

Port-channel configuration:

```
XV3-8-EC7708(config)# interface portchannel 1
XV3-8-EC7708(config-portchannel-1)#
advertise : Ethernet link speed advertisement
channel-group : Ethernet member channel group
clear : Clear command
duplex : Ethernet link duplex
shutdown : Shutdown interface
speed : Ethernet link speed
switchport : Configure switch port
tunnel-mode : Enable tunnelling of wired traffic over configured tunnel
apply : Apply configuration that has just been set
exit : Exit from interface configuration
no : Disable parameters
save : Save configuration to Flash so it persists across reboots
show : Show command
```

Syntax:

```
XV3-8-EC7708(config)# interface portchannel 1
XV3-8-EC7708(config-portchannel-1)# switchport mode trunk
XV3-8-EC7708(config-portchannel-1)# switchport trunk allowed vlan 1
XV3-8-EC7708(config-portchannel-1)# switchport trunk native vlan 1
XV3-8-EC7708(config-portchannel-1)#
```

Real Time Location System (RTLS)

Stanley AeroScout Location Engine [Premium feature](#)

The Location Engine delivers accurate and reliable location data for assets and customers with STANLEY Healthcare Wi-Fi tags. It is an integral component of STANLEY Healthcare's AeroScout RTLS solutions. The AeroScout Location Engine determines location using signal strength measurements (RSSI) collected by the Cambium Wi-Fi Access Points, that can simultaneously serve location sensors and provide network access. AeroScout utilizes a location engine to determine the position of Wi-Fi tags.

From Release 6.4 onwards, Bluetooth (BLE) tags are supported on XV3-8 and XV2-2T devices.

CLI Configuration:

```
XV3-8-EC7708(config)# rtls aeroscout
ble-tag : Enable Aeroscout BLE Tag
server : Configure Aeroscout Server IP or FQDN
server-port : Configure Aeroscout Server Port (Default port:12092)
wifi-tag : Enable Aeroscout WiFi Tag
```

Chapter 11: Operations

This chapter describes the following topics:

- [Overview](#)
- [Firmware upgrade](#)
- [System](#)
- [Configuration](#)

Overview

This chapter gives an overview of Enterprise Wi-Fi AP administrative functionalities such as Firmware update, System, and Configuration.

Firmware upgrade

The running software on the Cambium Enterprise Wi-Fi AP can be upgraded to newer firmware. When upgrading from the UI, the user can upload the firmware file from the browser. The same process can be followed to downgrade the AP to a previous firmware version if required. Configuration is maintained across the firmware upgrade process.

Note

Once a firmware upgrade has been initiated, the AP should not be rebooted or power cycled until the process completes, as this might leave the AP inoperable.

Table 56 lists the fields that are displayed in the **Operations > Firmware** update tab.

Table 56: Firmware update parameters

Parameters	Description	Range	Default
Choose File	Provisions to select upgrade files.	–	–
Upgrade Firmware	Provision to initiate upgrade once the file is selected.	–	–

To configure the above parameter, navigate to **Operations > Firmware update** tab and provide the details as given below:

1. Click **Choose File** and select the downloaded image file to upgrade the firmware manually.
2. Click **Upgrade Firmware** and select the downloaded image file to upgrade the firmware automatically.

You can view the status of the upgrade in the **Upgrade Status** field.

Figure 52: Firmware update parameters

Firmware update

Choose File No file chosen

Upgrade Firmware

Upgrade Status :

System

This section provides multiple troubleshooting tools provided by Enterprise Wi-Fi AP.

Table 57 lists the fields that are displayed in the **Operations > System** tab:

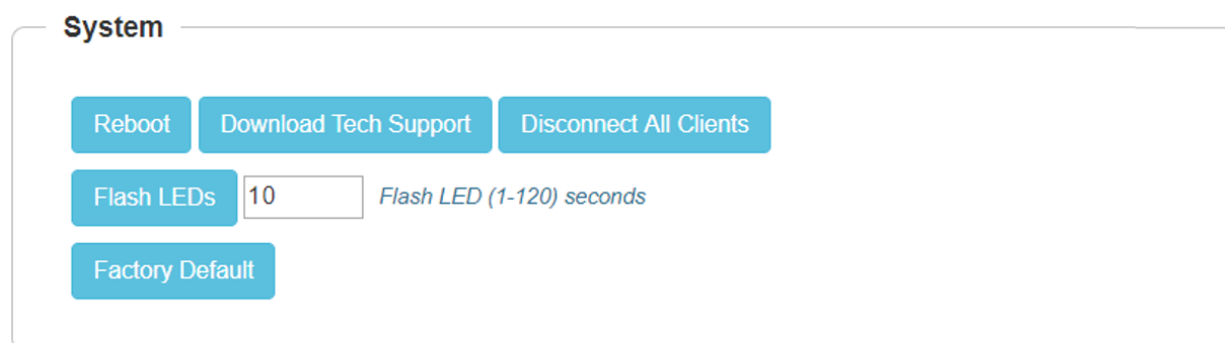

Table 57: System parameters

Parameters	Description	Range	Default
Reboot	Users will be prompted with a Reboot pop-up requesting a reboot. If yes, the device will go for a reboot.	-	-
Download Tech Support	Users will be prompted with permission to download tech support from AP. If yes, the file will be saved in your default download path configured on your system.	-	-
Disconnect All Clients	All clients connected to both the radios will be terminated by sending a de-authentication packet to each client connected to the radios.	-	-
Flash LEDs	LEDs on the device will toggle for the configured time period.	1-120	10
Factory Default	A pop-up window appears requesting confirmation for factory defaults. If yes, the device will delete all configurations to factory reset and reboot.	-	-

To configure the above parameter, navigate to the **Operations > System** tab and provide the details as given below:

1. Click **Reboot** for rebooting the device.
2. Click **Download Tech Support** to generate tech support from the device and save it locally.
3. Click **Disconnect All Clients** to disconnect all wireless clients.
4. Select **Flash LEDs** value from the drop-down list to flash LEDs for the given duration of time.
5. Click **Factory Default** to delete all configurations on the device.

Figure 53: System parameters

LED Test flashing pattern

The LED test flashing pattern for the Enterprise Wi-Fi 6 AP is as follows:

Flashing pattern (For XV3-8, XV2-2, XV2-2T0, XV2-2T1, XE5-8, and XE3-4): **Yellow -> Green -> Amber -> Blue**

Flashing pattern (For XV2-21X, XV2-23T, and XV2-22H): **Green -> Amber -> Blue**

CLI commands:

```
XV3-8-EC7708(config)# service flash-leds
```

```
Number of seconds to flash <1-120> (optional: default 10sec)
```

```
XV3-8-EC7708(config)# service test leds
```

Configuration

The device configuration can either be exported from the device as a text file or imported into the device from a previous backup. Ensure that when a configuration file is imported onto the device, a reboot is necessary to activate that new configuration.

Below table lists the fields that are displayed in the **Operations > Configuration** tab.

Figure 54: Configuration parameters

Parameters	Description	Range	Default
Export	Provision to export the configuration of the device to default download path configured on the system.	-	-
Import	Provision to import the configuration of the device.	-	-

To configure the above parameter, navigate to **Operations > Configuration** tab and provide the details as given below:

1. Click **Export** to export device configuration and save locally to the device.
2. Click **Import** to import device configuration to the device.

Figure 55: Configuration parameters

Chapter 12: Troubleshoot

Overview

This chapter provides detailed information about troubleshooting methods supported by Enterprise Wi-Fi APs. Troubleshooting methods supported by Enterprise Wi-Fi AP devices are categorized as below:

- [Logging](#)
 - [Debug Logs](#)
 - [Events](#)
- [Rdio Frequency \(RF\)a](#)
 - [Wi-Fi Analyzer](#)
- [Packet capture](#)
- [Performance](#)
 - [Connectivity](#)
 - [Speedtest on Access Point](#)
- [XIRCON tool support](#)
 - [XIRCON tool support for Linux 1.0.0.40](#)

Logging

Enterprise Wi-Fi AP devices support multi-level logging, which will ease debug issues.

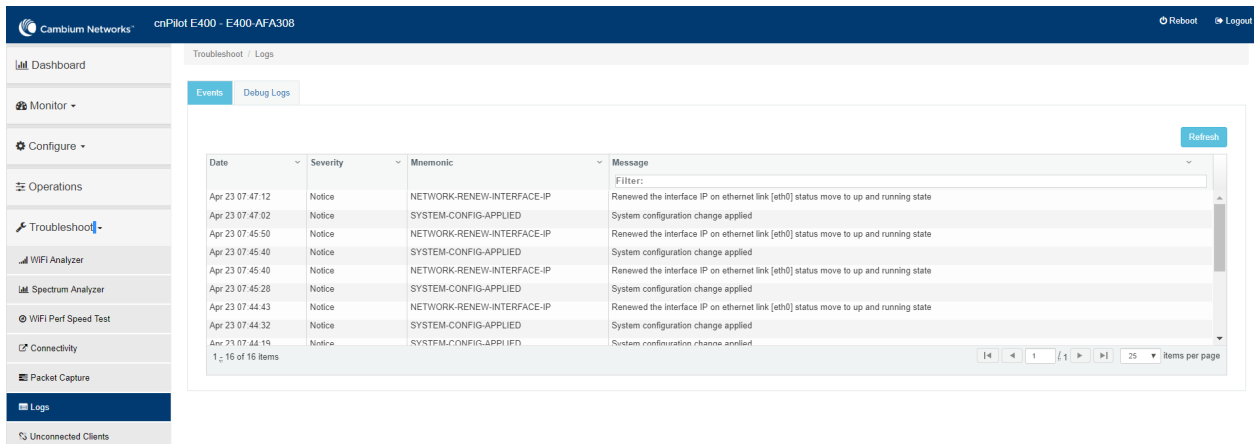

Events

Enterprise Wi-Fi AP devices generate events that are necessary for troubleshooting across various modules. Below is the list of modules, Enterprise Wi-Fi AP device generates events for troubleshooting.

- Wireless station
 - Connectivity
- Configuration updates
- RADIUS
 - Authentication
 - Accounting
 - CoA
- Roaming
 - Enhanced roaming
- Auto-RF
 - Channel change
- Reboot
- Guest Access

Events are available at **Troubleshoot > Logs > Events**.

Figure 56: Events parameters

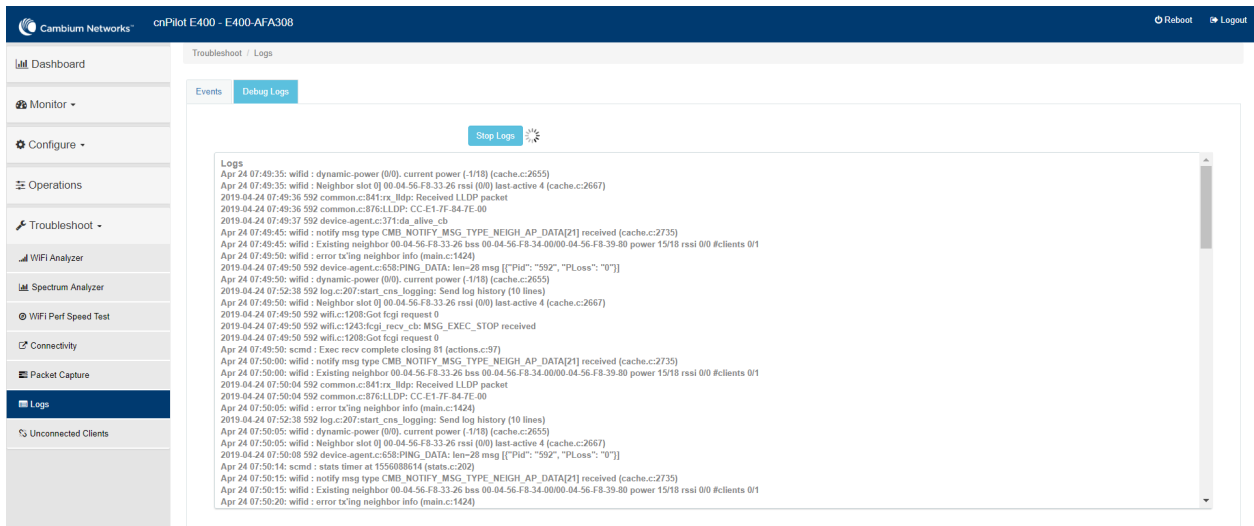

Debug Logs

Enterprise Wi-Fi AP provisions enhanced debugging of each module as events generated by system and scope of debugging is limited. Debug logs can be triggered when the user clicks **Start Logs** and can be terminated when clicked on Stop Logs. By default, debug logs auto terminate after 1 minute when clicked on Start Logs.

Debug logs are available at **Troubleshoot > Logs > Debug Logs** tab.

Figure 57: Debug Logs parameters

Radio Frequency (RF)

Wi-Fi Analyzer

This tool provisions customers to scan the channels supported as per regulatory domain and provides information related to AP's presence in each channel. Wi-Fi analyzer graphs are available in two modes:

- Interference

This tool shares more information about each channel as below:

- Noise
 - Interference measured in RSSI
 - List of top 64 neighbor APs
- Number of APs

This tool shares more information about each channel as below:

- Noise
- Number of neighbor APs
- List of top 64 neighbor APs

Channel analyzer is available at **Troubleshoot > Wi-Fi Analyzer > Interference Mode.**

Figure 58: *Interference Mode*

Channel analyzer is available at **Troubleshoot > Wi-Fi Analyzer > Number of APs Mode:**

Figure 59: Troubleshoot > Wi-Fi Analyzer > Number of APs Mode

Packet capture

Allows the administrator to capture packets from the APs UI, cnMaestro UI, or XMS-Cloud. The administrator can filter the packets being captured by specifying a particular MAC address, IP address, and port number. The user can trigger packet capture on one or more interfaces, simultaneously view the progress of the capture. The user can also download the captured pcap file on completion.

Enterprise Wi-Fi AP device allows packet capture on the following interfaces:

- Ethernet
- Radio
- Wireless LAN
- VLAN
- SSID
- TUNNEL
- BRIDGE

Multiple options of filtering are provided and are available **Troubleshoot > Packet Capture** page.

Figure 60: Packet Capture page

Packet Capture Result

#	Interface	Status	Count	Duration	Size	Channel	Filename	Filter	StartTime	EndTime	Action
1	eth1	completed	731	18/120	894KB/10MB	NA	XV3-8-EC7708-eth1.pcap		13-04-2021 19:22:55	13-04-2021 19:23:13	 

Performance

Speedtest on Access Point

Speedtest can be used to measure speed across the WAN to Cambium hosted servers. The CLI output displays uplink and downlink speed in Mbps. You can also host your server in your data center and measure bandwidth to it using the ETSI option and specifying the URL. The server software can be obtained from the LibreSpeed project <https://github.com/librespeed/speedtest>.

Configuration:

Syntax:

```
XV3-8-EC7708(config)# speedtest etsi
```

```
<server url> <download MB> <upload MB> [simultaneous connections] [mbps]
```

Example:

```
XV3-8-EC7708(config)# speedtest etsi 10.110.211.19:9000 200 200
Your IP is 10.110.240.202 - private IPv4 access
Latency: 14.5ms Jitter: 1.3ms
Download: 169.53Mbps Upload: 93.93Mbps
```

Connectivity

This tool helps to check the accessibility of remote hosts from Enterprise Wi-Fi AP devices. Three types of tools are supported under this category:

- Ping
- DNS Lookup
- Traceroute

Table 58: Troubleshoot: Connectivity

Parameters	Description	Range	Default
Ping			
IP Address or Hostname	Provide IPv4 address or Hostname to validate the reachability of the destined Host.	-	-
Number of Packets	Provide a number of request packets that are required to be transmitted to validate the reachability of the destined Host.	1-10	3
Buffer Size	Configure ICMP packet size.	1-65507	56
Ping Result	Displays the ICMP results.	-	-
DNS Lookup			
Host Name	Provide Hostname whose IP must be resolved.	-	-
DNS Test Result	Displays the IPs that are associated with configured Hostname.	-	-
Traceroute			
IP Address or Hostname	Provide IPv4 address or Hostname to validate the reachability of the destined Host.	-	-
Fragmentation	Provision to allow or deny fragment packets.	-	Off
Trace Method	Provision to configure payload mechanism to check the reachability of destined IPv4/Hostname.	-	ICMP Echo
Display TTL	Provision to customize TTL display.	-	On
Verbose	Provision to display the output of traceroute.	-	On
Traceroute Result	Displays the output of the traceroute command.	-	-

To configure the above parameter, navigate to the **Troubleshoot > Connectivity** tab and provide the details as given below:

To configure **Ping**:

1. Select **Test type** from the drop-down list.
2. Enter IP address or **Hostname** in the text box.
3. Enter the **Number of Packets** in the text box.
4. Select **Buffer Size** value from the drop-down list.
5. Click **Start Ping**.

To configure **DNS Lookup**:

1. Enter the **Hostname** in the text box.
2. Click **DNS Test**.

To configure **Traceroute**:

1. Enter **IP address** or **Hostname** in the text box.
2. Click **Fragmentation** to ON/Off.
3. Select **Trace Method** to either **ICMP Echo/UDP**.
4. Click **Display TTL** to ON/Off.
5. Click **Verbose** to ON/Off.
6. Click **Start Traceroute**.

Figure 61: Connectivity (Ping) parameters

Troubleshoot / Connectivity

Test Type : **Ping**

IP Address or Hostname :

Number of Packets : Min = 1, Max = 10

Buffer Size : Min = 1, Max = 65507

Ping Result
PING www.google.com (216.58.197.68): 56 data bytes
64 bytes from 216.58.197.68: seq=0 ttl=56 time=7.428 ms
64 bytes from 216.58.197.68: seq=1 ttl=56 time=7.131 ms
64 bytes from 216.58.197.68: seq=2 ttl=56 time=7.359 ms

--- www.google.com ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 7.131/7.306/7.428 ms

XIRCON tool support

The Xirrus console (Xircon) is a necessary tool for daily management, troubleshooting, and testing. Xirrus customers and field engineers used them for initial configuration, troubleshooting individual AP problems, changing IP addresses, and recovering units that would not boot. Since Cambium Networks acquired Xirrus and we expect the XV series APs to be deployed along with legacy Xirrus APs, limited Xircon support is added to the XV series APs.

The name "Xircon" refers to the feature in general, including the AP functionality, the communication protocol, and the client software used for discovering and controlling Xirrus APs.

- Xircon detects APs by listening for Xircon beacon packets. These packets are sent via UDP to a defined port and multicast address. These are the existing Multicast beacons sent by AOS.
- Control is established over unicast UDP on a different port from discovery. Only one client device can control an AP at any given time.
- Individual packets are RC4 encrypted. The payload includes a hash to ensure that any tampering or packet corruption is detected, and the packet discarded.
- Starting with Release 6.2, Enterprise Wi-Fi APs can be detected by Xirrus AOS APs and the Xircon client. It is not possible to establish a Xircon console connection to XV series APs - for that identify the IP address from Xircon and use standard SSH to connect.

XIRCON tool support for Linux 1.0.0.40

XIRCON tool support for Linux 1.0.0.40 has been added which is used to discover APs in the network if the IP address is not known.

Chapter 13: Management Access

This chapter describes different methods of authenticating users to access device UI. Following are the authentication methods supported by Enterprise Wi-Fi AP devices:

- [Local authentication](#)
- [SSH-Key authentication](#)
- [RADIUS authentication](#)

Local authentication

This is the default authentication mode enabled on the device. Only one username is supported which is “admin”. The default password for the “admin” username is “admin”. The user has a provision to configure/update password.

Device configuration

The below figure shows how to configure/update the default password of the admin user.

1. Under **Management**, enter Admin Password.
2. Click **Save**.

Figure 64: Configure/update default password of the admin user

The screenshot shows the Cambium Networks web interface for a cnPilot E400 - E400-AFA308 device. The interface is divided into two main sections: System and Management. The System section includes fields for Name (E400-AFA308), Location, Contact, Country-Code (India), Placement (Indoor selected), LED (checked), and LLDP (unchecked). The Management section includes fields for Admin Password (masked), Autopilot (Default), Teinet (unchecked), SSH (checked), SSH Key (empty), HTTP (checked), and HTTP Port (80).

SSH Key authentication

SSH keys are also used to connect remote machines securely. They are based on the SSH cryptographic network protocol, which is responsible for the encryption of the information stream between two machines. Ultimately, using SSH keys users can connect to remote devices without even entering a password and much more securely too. SSH works based on “public-key cryptography”. For simplicity, let us consider that SSH keys come in pairs. There is a private key, that is safely stored to the home

machine of the user and a public key, which is stored to any remote machine (AP) the user wants to connect. So, whenever a user initiates an SSH connection with a remote machine, SSH first checks if the user has a private key that matches any of the public keys in the remote machine and if not, it prompts the user for a password.

Device configuration

SSH Key-based access method can be configured on the device using standalone AP or from cnMaestro. Navigate to System > Management and configure the following:

1. Enable **SSH** checkbox.
2. Provide Public key generated from steps described in SSH Key generation section.

Figure 65: Management parameters

The screenshot shows the configuration interface for a Cambium Networks device. The left sidebar contains navigation options: Dashboard, Monitor, Configure, System (selected), Radio, WLAN, Network, Services, Operations, and Troubleshoot. The main content area is titled 'Configure / System' and is divided into two sections: 'System' and 'Management'.

System Configuration:

- Name: E400-AFA308 (Hostname of the device (max 64 characters))
- Location: (Location where this device is placed (max 64 characters))
- Contact: (Contact information for the device (max 64 characters))
- Country-Code: India (For appropriate regulatory configuration)
- Placement: Indoor (selected), Outdoor (Configure the AP placement details)
- LED: Whether the device LEDs should be ON during operation
- LLDP: Whether the AP should transmit LLDP packets

Management Configuration:

- Admin Password: (Configure password for authentication of GUI and CLI sessions)
- Autopilot: Default (Autopilot Management of APs)
- Telnet: Enable Telnet access to the device CLI
- SSH: Enable SSH access to the device CLI
- SSH Key: (Use SSH keys instead of password for authentication)
- HTTP: Enable HTTP access to the device GUI
- HTTP Port: 80 (Port No for HTTP access to the device GUI(1-65535))
- HTTPS: Enable HTTPS access to the device GUI
- HTTPS Port: 443 (Port No for HTTPS access to the device GUI(1-65535))

SSH Key generation

Windows

The PUTTY tool can be used to generate both Public and Private Keys. Below is a sample demonstration of configuring Enterprise Wi-Fi AP device and logging using SSH Key via UI.

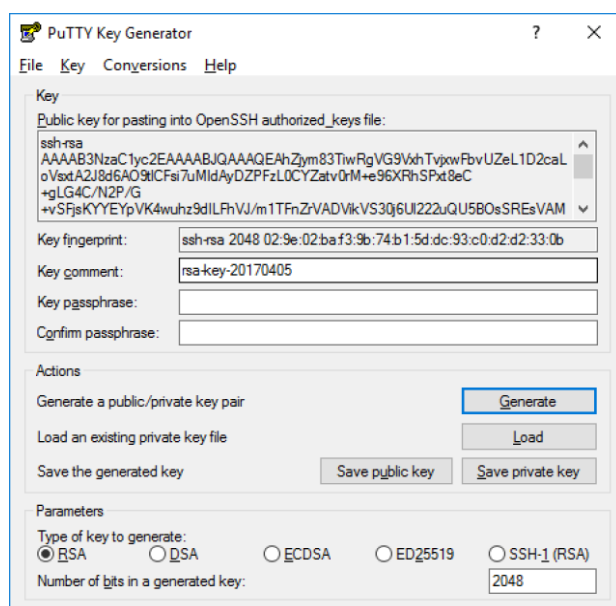

1. Generate a key pair in PUTTY Key Generator as shown in [Chapter 13](#).

Figure 66: Generating public/private Key

2. Save the Public key and Private key once the key pair is generated as shown in Chapter 13.

Figure 67: Public and Private Key

3. Save the Public key generated in the step above as described in Device configuration section.
4. Login to device using Private key generated above with username as “admin”.

Linux

If using a Linux PC and SSH from the Linux host, then you can generate the keys with the following steps:

1. Generate key pair executing below command on Linux console as shown in Chapter 13.

Figure 68: Public Key location path

```
pk@ubuntu:~$ ssh-keygen -t rsa
Generating public/private rsa key pair.
Enter file in which to save the key (/home/pk/.ssh/id_rsa):
Created directory '/home/pk/.ssh'.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/pk/.ssh/id_rsa.
Your public key has been saved in /home/pk/.ssh/id_rsa.pub.
The key fingerprint is:
SHA256:0qt4vJduO4uvsdpPtPkNzQ9uorlH7ydwE9fiEXOh0Kao pk@ubuntu
The key's randomart image is:
+----[RSA 2048]-----+
|
|             ..|
|            .+.o|
|           . . . =.*|
|          . S.. = o|
|         .oo*... o|
|        . .+E.. . .|
|       oo*X. + +
|      ooBXOO. = .
|
+----[SHA256]-----+
pk@ubuntu:~$
```

2. The Public key is now located in PATH mentioned in [Chapter 13](#).
PATH = “Enter the file to which to save the key”
3. The private key (identification) is now saved in PATH as mentioned in [Figure 69](#).
PATH = “Your identification has saved in <>”

Figure 69: Private Key saved path

```
pk@ubuntu:~$ cat /home/pk/.ssh/id_rsa.pub
ssh-rsa AAAAB3NzaClyc2EAAAADAQABAAQDfZq+gc13qG8DlckyFU2JqyW5pI9q8P0MrVtrM9Vu5

pk@ubuntu:~$
pk@ubuntu:~$
```

4. Save the Public key generated in step above as described in Device configuration section.
5. Login to device using Private key generated above with username as “admin”.

RADIUS authentication

Device management access using RADIUS authentication allows multiple users to access using unique credentials and is secured.

Device configuration

Management access using the RADIUS authentication method can be configured on the device using standalone AP or from cnMaestro. Navigate to **System > Management** and configure the following:

1. Enable **RADIUS Mgmt Auth** checkbox.
2. Configure **RADIUS IPv4/Hostname** and shared secret in **RADIUS Server** and **RADIUS Secret** parameters respectively.
3. Click **Save**.

Figure 70: RADIUS Server and RADIUS Secret parameters

The screenshot shows the configuration page for a Cambium Networks device. The left sidebar contains navigation options: Dashboard, Monitor, Configure, System (selected), Radio, WLAN, Network, Services, Operations, and Troubleshoot. The main content area is divided into two sections: System and Management.

System Section:

- Name: E400-AFA308
- Location: (empty)
- Contact: (empty)
- Country-Code: India
- Placement: Indoor (selected), Outdoor
- LED: Whether the device LEDs should be ON during operation
- LLDP: Whether the AP should transmit LLDP packets

Management Section:

- Admin Password: (masked)
- Autopilot: Default
- Telnet: Enable Telnet access to the device CLI
- SSH: Enable SSH access to the device CLI
- SSH Key: (empty)
- HTTP: Enable HTTP access to the device GUI
- HTTP Port: 80
- HTTPS: Enable HTTPS access to the device GUI
- HTTPS Port: 443
- RADIUS Mgmt Auth: Enable RADIUS authentication of GUI/CLI sessions
- RADIUS Server: (empty)
- RADIUS Secret: (empty)

4. Login to the device using appropriate credentials as shown in the below figure.

Figure 71: UI Login page

The screenshot shows the login interface. At the top, there is a blue header with the text "Login". Below the header, there is a red-bordered box containing the login form. The form has three main elements: a user selection dropdown menu with "bob" selected, a password input field with masked characters, and a blue "Sign In" button.

Chapter 14: Mesh

From Release 6.4 onwards, Enterprise Wi-Fi 6 Access Point supports mesh connections between radios. Even though multiple mesh hop is supported in Release 6.4, the suggested maximum hops are two. Mesh links can form between radios of the same band of operation (2.4 GHz, 5 GHz, and 6 GHz), but the two peers of the mesh link do not have to be of the same AP type. For example, a link between Wi-Fi 6 XV2-2 and XV3-8 is supported. Given the larger set of available channels and typically cleaner RF environment, Cambium Networks recommends using the 6 GHz radio for mesh backhaul if the AP is 6 GHz-capable, else use the 5 GHz band.

A mesh link can be created between two radios by configuring one of them as a Base and the other as a Client on the first WLAN of the AP. Typically, the wired connectivity AP would be configured as a Mesh Base (MB). The radio setup for the MB selects a channel and starts transmitting beacons as soon as the AP comes up. The Mesh Client (MC) radio setup scans all available channels, looking for an MB radio to connect with. The SSID in the mesh WLAN is how the client and base radios of a mesh link identify each other, the same SSID should be configured on the MB WLAN as well as the MC WLAN.

In addition to a simple topology between a base and a client, a star or hub-and-spoke mesh topology is also supported; practically a mesh radio can service up to 10-12 Mesh Clients connected to it. When a radio is configured with a mesh WLAN, on that WLAN other clients are allowed to connect, and the radio can service clients on other WLANs mapped to it. Note that a client radio starts rescanning all available channels as soon as it loses connectivity to the base. Other WLANs mapped to it are not operational during this scan period.

The mesh link can also be secured with WPA2/WPA3-Preshared-Keys (PSK). The same passphrase should be configured on both the MB as well as the MC. Standard 802.11 security handshakes and AES-CCM encryption are then used on the mesh link.

For WPA2-PSK, the maximum number of allowed characters is 64 whereas for WPA3-PSK, it is 63.

Deployment scenarios

Enterprise Wi-Fi APs support single and multi-hop mesh connections, although single hop mesh is highly advisable.

Enterprise Wi-Fi APs support the following deployment scenarios:

- Between Wi-Fi 6 APs
- Mixed deployment (between Wi-Fi 6 APs and Wi-Fi 5 APs)
- With third-party APs - TP-Link, Mikrotik, Ligo wave

The following figures illustrate the working scenario of a wireless mesh network.

Figure 72: Single hop mesh connection in 5 GHz with two Mesh Clients

Figure 73: Single hop mesh connection in 5 GHz with two Mesh Clients and 2.4 GHz and 5 GHz as access

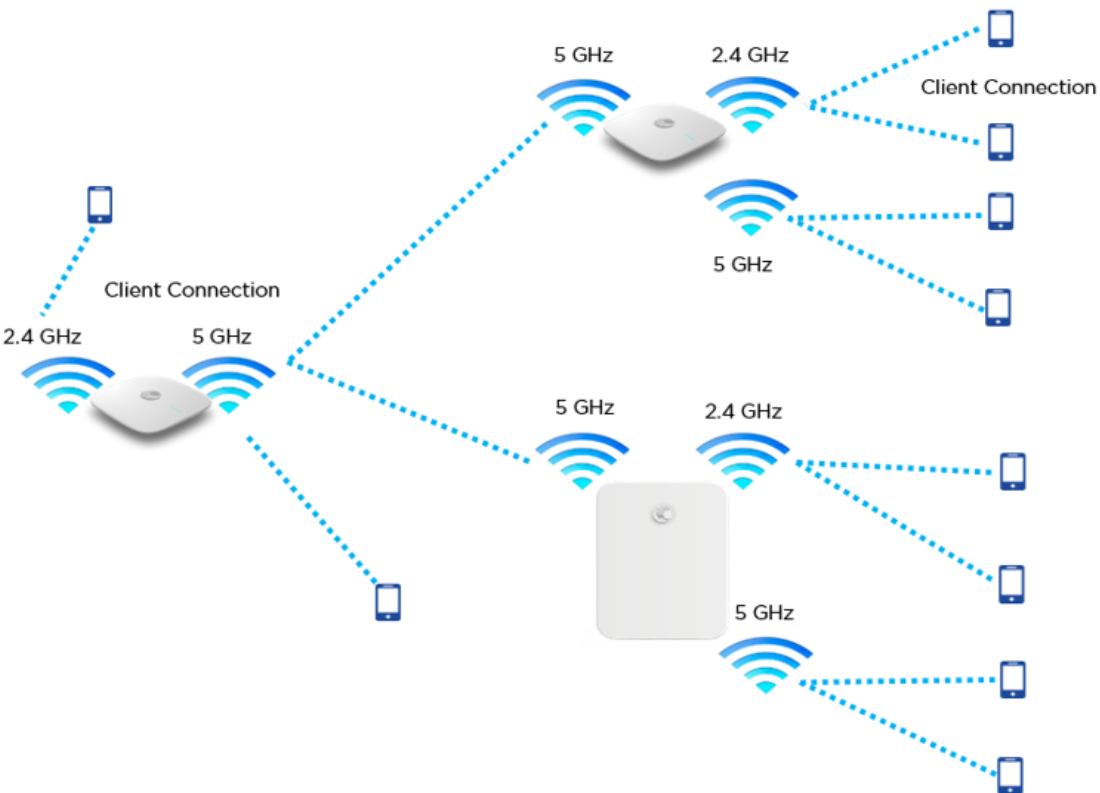

Figure 74: Single hop mesh Connection in 6 GHz with two Mesh Clients

For a stable mesh link to be established, Enterprise Wi-Fi mesh is configurable in the following three modes:

- Mesh Base (MB)

Enterprise Wi-Fi device that operates in MB mode is the key to Mesh topology. MB is usually connected to the wired network. The radio setup for MB selects a channel and starts transmitting beacons as soon as the AP comes up.

- Mesh Client (MC)

Enterprise Wi-Fi device that operates in MC mode, scans all available channels supported as per regulatory domain and establishes a link with MB.

- Mesh Recovery (MR)

When enabled, this mode helps maintain the mesh link if there is a disruption in the backhaul link established with MB and MC. Mesh link disruption can cause due to PSK mismatch or due to asynchronous configurations on MB and MC. This mode needs to be exclusively enabled on MB devices.

This mode can also help in the Zero Touch Configuration of the Enterprise Wi-Fi device.

Mesh configurable parameters

The below table lists the configurable parameters that are exclusive to mesh:

Table 59: Mesh configurable parameters

Parameter	Description	Range	Default
Mesh	<p>This parameter is required when a mesh connection is established with Enterprise Wi-Fi devices. Four options are available under this parameter:</p> <ol style="list-style-type: none"> 1. Base <p>A WLAN profile configured with a Mesh Base operates like a normal AP. Its radio beacon is on startup so its SSID can be seen by radios configured as Mesh Clients.</p> 2. Client <p>A WLAN profile configured with a Mesh Client scans all available channels on startup, looking for a mesh-based AP to connect.</p> 3. Recovery <p>A WLAN profile configured as mesh-recovery broadcast pre-configured SSID upon detection of mesh link failure after a successful connection. This needs to be exclusively configured on the mesh-base device. Mesh Client auto-scan for mesh-recovery SSID upon failure of mesh link.</p> 	-	Off
SSID	SSID is the unique network name to which MC connects and establishes mesh links.	-	-
VLAN	Management VLAN to access all devices in a mesh topology.	1-4094	1
Security	For configurable parameters, refer to Chapter 6: Security section.	-	Open
Passphrase	A string that is a key value to generate keys based on the security method configured.	-	12345678
Radios	<p>Each SSID can be configured to be transmitted as per the deployment requirement. For a mesh WLAN profile, options available to configure the band:</p> <ul style="list-style-type: none"> • 2.4 GHz • 5 GHz • 6 GHz 	-	2.4 GHz
Hide SSID	This is the basic security mode of a Wi-Fi device. This parameter when enabled, will not broadcast SSID.	-	Disabled
SNR-threshold	Mesh Clients trigger a disconnect when SNR is below configured value. This is the applicable configuration on the MB.	1-100	Disabled
Mesh Recovery	Configure the interval for the consecutive ping loss seen after which the mesh link is considered to be down and a reconnect is	5-30 min	30

Parameter	Description	Range	Default
Interval	attempted. One can configure the duration and interval to be the same, in which case the first ping losses trigger the reconnect.		
Mesh Auto Detect Backhaul	<ol style="list-style-type: none"> 1. Single Hop Both Mesh Client and MB profiles are configured on the devices. When enabled, this feature triggers when an MB losses Ethernet connectivity. Mesh Client profile automatically gets enabled and establishes a mesh link with the nearest MB. For the MB profile to get auto-disabled, uncheck Mesh Multi-Hop. 2. Multi-Hop Consider Mesh Client AP is connected to an MB AP which has an Ethernet backhaul connection. In case MB which has the backhaul connection loses the Ethernet connectivity, both APs disconnect from the network. When Auto detected Backhaul is enabled on the MB, it automatically enables the MC profile and connects to the nearest MB ensuring the connectivity for self as well as the client behind. Mesh Multi-Hop check should be enabled for this feature to be active. 3. Mesh Monitored Host This parameter is exclusive to Mesh Client devices when Auto-Detect Backhaul is enabled with an extended network via the Ethernet of the device. Configure IP or Hostname to check the link status. 	-	Disabled
Mesh Client Monitor	<ol style="list-style-type: none"> 1. Duration Duration in minutes of ping failure after which mesh connectivity is re-established. 2. Host Configure a server to monitor with ping to decide if mesh connectivity needs to be re-established. 	-	-
Mesh Vlan Tagging	Enable the VLAN tagging over the mesh link. This applies only to the Cambium mesh topology.	-	Enabled

Order of Mesh profile configuration

If a device is configured as Mesh Base/client/recovery, the recommended order of WLAN configuration should be as follows:

- WLAN profile 1: Mesh Base
- WLAN profile 2: Mesh Client
- WLAN profile 3: Mesh Recovery

Mesh Base (MB)

To configure the MB:

cnMaestro configuration:

WLANs > Ent_Mesh_Base

Configuration Devices

WLAN

AAA Servers

Guest Access

Access Control

Basic Information

Type*
Enterprise Wi-Fi

Name*
Ent_Mesh_Base

Description

Basic Settings

SSID

Enable

SSID*
CAMBIUM_MESH_BASE The SSID of this WLAN (up to 32 characters)

Mesh

Base Mesh Base/Client/Recovery mode

VLAN*

1 Default VLAN assigned to clients on this WLAN (1-4094)

Security

WPA2 Pre-Shared Keys Set authentication and encryption type

Passphrase*
..... Show WPA2 Pre-shared security passphrase or key

Band

2.4 GHz 5 GHz 6 GHz Define radio types (2.4 GHz, 5 GHz, 6 GHz) on which this WLAN should be supported

Client Isolation

Disable

When selected, it allows wireless clients connected to the same AP or different APs to communicate with each other in the same VLAN

Hide SSID Do not broadcast SSID in beacons

Mesh VLAN Tagging Enable the vlan tagging over mesh link

Mesh Auto Detect Backhaul Enable the ethernet link status detection and try to connect over mesh link

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# Mesh Base
XV3-8-EC7708(config-wlan-1)# ssid CAMBIUM_MESH_BASE
XV3-8-EC7708(config-wlan-1)# security wpa2-psk
XV3-8-EC7708(config-wlan-1)# passphrase 12345678
XV3-8-EC7708(config-wlan-1)# VLAN 1
XV3-8-EC7708(config-wlan-1)# band 5GHz
```

Mesh Client (MC)

To configure the MC:

cnMaestro configuration:

WLANs > Ent_Mesh_Client

Configuration Devices

WLAN

Basic Information

Type*
Enterprise Wi-Fi

Name*
Ent_Mesh_Client

Description

User-Defined Overrides

Advanced configuration settings entered below will be applied on top of the AP Group settings sent to the device. This allows you to apply configuration not supported in the previous screens. If there are conflicts, the below settings will take precedence. The format used is the same as a configuration file exported from the device via its web UI or the "View Device Configuration" link in the device level configuration page.

Variables and Macros

Settings entered are not validated or error-checked (However, dollar (\$), period (.) or space characters are not allowed in a variable name and it should not be more than 64 characters long), and they may overwrite configuration made in previous screens, so please use them with caution. You are responsible for ensuring the resulting AP Group is valid and safe to use.

```
!
wireless wlan 1
mesh-recovery-interval 5
mesh-client-monitor host 8.8.8.8
mesh-client-monitor duration 2
!
```

CLI configuration:

```
XV3-8-EC7708(config)# wireless wlan 1
XV3-8-EC7708(config-wlan-1)# mesh client
XV3-8-EC7708(config-wlan-1)# ssid CAMBIUM_MESH_BASE
XV3-8-EC7708(config-wlan-1)# vlan 1
XV3-8-EC7708(config-wlan-1)# security wpa2-psk
XV3-8-EC7708(config-wlan-1)# passphrase 12345678
XV3-8-EC7708(config-wlan-1)# band 5GHz
```

```
XV3-8-EC7708(config-wlan-1)# mesh-recovery-interval 30
XV3-8-EC7708(config-wlan-1)# mesh-client-monitor duration 5
XV3-8-EC7708(config-wlan-1)# mesh-client-monitor host 8.8.8.8
```

Mesh Recovery (MR)

To support plug and play Mesh deployment model, suggest configuring the MR profile on the MB AP. As a result, factory reset APs/New APs can establish a mesh connection to the MB right away (out of the box).

A recovery profile is also useful when an MC loses connectivity to a base due to misconfiguration or a bad connection that causes frequent drops.

To configure the MR:

cnMaestro configuration:

The screenshot shows the 'WLANs > Ent_Mesh_Recovery' configuration page in cnMaestro. The page has two tabs: 'Configuration' (selected) and 'Devices'. On the left, there is a sidebar with 'WLAN' and 'Access Control'. The main content area is split into two sections: 'Basic Information' and 'Basic Settings'.

Basic Information:

- Type*: Enterprise Wi-Fi (dropdown)
- Name*: Ent_Mesh_Recovery (text input)
- Description: (empty text input)

Basic Settings:

- SSID: Enable
- Mesh: Recovery (dropdown) - Mesh Base/Client/Recovery mode
- VLAN*: 1 (text input) - Default VLAN assigned to clients on this WLAN (1-4094)
- Transition SSID: (empty text input) - Configure the matching open/owe transition SSID
- Band: 2.4 GHz 5 GHz 6 GHz - Define radio types (2.4 GHz, 5 GHz, 6 GHz) on which this WLAN should be supported

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mesh recovery
XV3-8-EC7708(config-wlan-1)# vlan 1
XV3-8-EC7708(config-wlan-1)# band 5GHz
```

Please refer to the [Cambium Zero touch White paper](#) on mesh for more information on Zero touch Mesh.

Mesh SNR-threshold

SNR-threshold configuration parameter is supported via CLI and can also be provisioned via cnMaestro on the MB WLAN profile. This parameter helps in maintaining the quality of the mesh link by denying MCs which has a low SNR value than the configured threshold.

cnMaestro configuration:

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mesh snr-threshold 60
```

Mesh Mode

Enterprise Wi-Fi 6 APs support multi-radio, and by default channel distribution, is enabled. When channel distribution is enabled, each radio is mapped with a group of channels that it can operate.

When a device operates in MC, it will scan channels that are supported by the radio. Hence, there is a high possibility that MC will never connect to MB. Mesh mode configuration is supported at the RADIO level. To maintain the consistent link, the user has provision exclusively to configure mode on the radio to ensure that Mesh Clients are always connected to the network. To configure the Mesh mode:

cnMaestro configuration:

CLI configuration:

```
XV3-8-EC7708(config-radio-1)# allowed-wlan-modes mesh
```

Mesh ACL

ACL can be used to make sure that the Mesh Client connecting to the base AP is a known AP. The Mesh Client radio MAC address can be added to the Mesh Base AP to achieve this.

Following are the various modes of MAC authentication supported by Enterprise Wi-Fi APs:

- Allow

To enable this mode, add the list of MAC addresses either to be allowed or denied under “mac-authentication list <Radio MAC of Mesh Client>” and configure the device as below:

cnMaestro configuration:

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mac-authentication policy allow
```

- Deny

To enable this mode, add the list of MAC addresses either to be allowed or denied under “mac-authentication list <Radio MAC of Mesh Client>” and configure the device as below:

cnMaestro configuration:

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mac-authentication policy deny
```

- RADIUS

To enable this mode, configure the device (described in Chapter 7: Radius server section) on the MB WLAN profile as below:

cnMaestro configuration:

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mac-authentication policy radius
```

- cnMaestro

To enable this mode, define the MAC addresses allowed or denied as described in the cnMaestro On-Premises User Guide Association ACL section and configure the device on

the MB WLAN profile as below:

cnMaestro configuration:

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mac-authentication policy cnMaestro
```

Mesh Auto Detect Backhaul

Mesh Auto Detect backhaul is a mechanism to enable MB or MC WLAN profile based on the status of ethernet of a device that is operating in mesh mode. Enterprise Wi-Fi 6 APs are multi-radio and multi-ethernet supported, hence there are multiple ways of configuring this feature based on the number of ethernet ports of a device.

In general, customers use a single AP group to configure any mesh devices in a network. When this feature is enabled, the device is intelligent enough to decide whether it has to operate in MB or MC mode. Below are different scenarios (AP2), where this feature can trigger a change in the mesh mode of the device.

Scenario 1

When a single AP Group is used for both MB and MC, AP2 can decide its mesh mode based on eth1 and eth2 connections. To auto-trigger, the type of mesh mode below configuration needs to be pushed on all APs in the mesh link.

Based on eth1 and eth2 physical link and reachability to 8.8.8.8 determines the state of mesh mode of AP2. Below is a matrix that explains AP2 behavior:

Eth 1	Eth 2	8.8.8.8 Reachability	MB	MC
<ul style="list-style-type: none"> Connected No data enabled 	Connected with no network reachability	No	Disabled	Enabled
<ul style="list-style-type: none"> Connected No data enabled 	Connected with network reachability	Yes	Enabled	Disabled
<ul style="list-style-type: none"> Connected Data-enabled 	Connected with no network reachability	No	Disabled	Enabled
<ul style="list-style-type: none"> Connected 	Connected with no network reachability	Yes	Enabled	Disabled

Eth 1	Eth 2	8.8.8.8 Reachability	MB	MC
<ul style="list-style-type: none"> Data-enabled 				
<ul style="list-style-type: none"> Connected Data-enabled 	Connected with network reachability	Yes	Enabled	Disabled

Figure 75: Deployment Scenario 1

Scenario 2

When a single AP Group is used for both MB and MC, AP2 can decide its mesh mode based on eth1 connections. To auto-trigger, the type of mesh mode below configuration needs to be pushed on all APs in the mesh link.

Eth 1	8.8.8.8 Reachability	MB	MC
<ul style="list-style-type: none"> Connected No data enabled 	No	Disabled	Enabled
<ul style="list-style-type: none"> Connected Data-enabled 	No	Disabled	Enabled
<ul style="list-style-type: none"> Connected Data-enabled 	Yes	Enabled	Disabled

Figure 76: Deployment Scenario 2

Scenario 3

When a single AP Group is used for both MB and MC, AP2 can decide its mesh mode based on eth1 connections. To auto-trigger, the type of mesh mode below configuration needs to be pushed on all APs in the mesh link.

Eth 1	8.8.8.8 Reachability	MB	MC
Connected	No	Disabled	Enabled

Figure 77: Deployment Scenario 3

To enable this configuration either from cnMaestro or CLI, follow the below guidelines:

cnMaestro configuration:

XV3-8-EC7708(config-radio-2)# mesh-client-bgscan long-interval 300
XV3-8-EC7708(config-radio-2)# mesh-client-bgscan short-interval 60

```

Mesh link-Sample configuration

This section briefs about the configuration of the device to get a mesh link established with different deployment scenarios.

VLAN 1 as the management interface

Follow the below CLI commands to establish a mesh link with VLAN 1 as the management interface:

- To configure MB and MR, following are the commands:
 - WLAN MB profile

cnMaestro configuration:

WLANs > Ent_Mesh_Base

Configuration Devices

WLAN

AAA Servers

Guest Access

Access Control

SSID

Enable

SSID* The SSID of this WLAN (up to 32 characters)

Mesh

Base Mesh Base/Client/Recovery mode

VLAN*

Default VLAN assigned to clients on this WLAN (1-4094)

Security

WPA2 Pre-Shared Keys Set authentication and encryption type

Passphrase* WPA2 Pre-shared security passphrase or key

Band

2.4 GHz 5 GHz 6 GHz Define radio types (2.4 GHz, 5 GHz, 6 GHz) on which this WLAN should be supported

Client Isolation

Disable

When selected, it allows wireless clients connected to the same AP or different APs to communicate with each other in the same VLAN

Hide SSID Do not broadcast SSID in beacons

Mesh Vlan Tagging Enable the vlan tagging over mesh link

Mesh Auto Detect Backhaul Enable the ethernet link status detection and try to connect over mesh link

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mesh base
XV3-8-EC7708(config-wlan-1)# ssid CAMBIUM_MESH_BASE
XV3-8-EC7708(config-wlan-1)# security wpa2-psk
XV3-8-EC7708(config-wlan-1)# passphrase 12345678
XV3-8-EC7708(config-wlan-1)# VLAN 1
XV3-8-EC7708(config-wlan-1)# band 5GHz
```

- WLAN MR profile

cnMaestro configuration:

WLANs > Ent_Mesh_Recovery

Configuration Devices

WLAN

Access Control

Basic Information

Type*
Enterprise Wi-Fi

Name*
Ent_Mesh_Recovery

Description

Basic Settings

SSID

Enable

Mesh

Recovery Mesh Base/Client/Recovery mode

VLAN*
1 Default VLAN assigned to clients on this WLAN (1-4094)

Transition SSID
Configure the matching open/owe transition SSID

Band

2.4 GHz 5 GHz 6 GHz Define radio types (2.4 GHz, 5 GHz, 6 GHz) on which this WLAN should be supported

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mesh recovery
XV3-8-EC7708(config-wlan-1)# vlan 1
XV3-8-EC7708(config-wlan-1)# band 5GHz
```

2. To configure MC, following are the commands:

cnMaestro configuration:

WLANs > Ent_Mesh_Client

Configuration Devices

WLAN

Basic Settings

SSID
 Enable
 SSID*
 The SSID of this WLAN (up to 32 characters)

Mesh
 Mesh Base/Client/Recovery mode

VLAN*
 Default VLAN assigned to clients on this WLAN (1-4094)

Security
 Set authentication and encryption type

Passphrase*
 WPA2 Pre-shared security passphrase or key

Band
 2.4 GHz 5 GHz 6 GHz Define radio types (2.4 GHz, 5 GHz, 6 GHz) on which this WLAN should be supported

Mesh Vlan Tagging Enable the vlan tagging over mesh link

Advanced Settings

Mesh Monitored Host
 IP or hostname that if not reachable a mesh recovery is attempted

Mesh Monitor Duration
 Duration in minutes (5-60)

Mesh Recovery Interval
 Interval in minutes after which a full recovery is attempted if the mesh base is not reachable (5-30)

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mesh client
XV3-8-EC7708(config-wlan-1)# ssid CAMBIUM_MESH_BASE
XV3-8-EC7708(config-wlan-1)# vlan 1
XV3-8-EC7708(config-wlan-1)# security wpa2-psk
XV3-8-EC7708(config-wlan-1)# passphrase 12345678
XV3-8-EC7708(config-wlan-1)# band 5GHz
XV3-8-EC7708(config-wlan-1)# mesh-recovery-interval
XV3-8-EC7708(config-wlan-1)# mesh-recovery-interval 30
XV3-8-EC7708(config-wlan-1)# mesh-client-monitor
XV3-8-EC7708(config-wlan-1)# mesh-client-monitor duration 5
XV3-8-EC7708(config-wlan-1)# mesh-client-monitor host 8.8.8.8
```

- To configure the Management VLAN interface, following are the commands:

cnMaestro configuration:

CLI configuration:

```
XV3-8-EC7708(config)# interface vlan 1
XV3-8-EC7708(config-vlan-1)# ip address dhcp
XV3-8-EC7708(config-vlan-1)# exit
XV3-8-EC7708(config)# interface eth 1
XV3-8-EC7708(config-eth-1)# switchport mode trunk
XV3-8-EC7708(config-eth-1)# switchport trunk native vlan 1
XV3-8-EC7708(config-eth-1)# switchport trunk allowed vlan 2-4094
```

Non-VLAN 1 as the management interface

Follow the below CLI commands to establish a mesh link with non-VLAN 1 as the management interface:

1. To configure MB and MR, following are the commands:
 - WLAN MB profile

cnMaestro configuration:

WLANs > Ent_Mesh_Base

Configuration Devices

WLAN

AAA Servers

Guest Access

Access Control

Basic Settings

SSID

Enable

SSID*

CAMBIUM_MESH_BASE The SSID of this WLAN (up to 32 characters)

Mesh

Base Mesh Base/Client/Recovery mode

VLAN*

10 Default VLAN assigned to clients on this WLAN (1-4094)

Security

WPA2 Pre-Shared Keys Set authentication and encryption type

Passphrase*

..... Show WPA2 Pre-shared security passphrase or key

Band

2.4 GHz 5 GHz 6 GHz Define radio types (2.4 GHz, 5 GHz, 6 GHz) on which this WLAN should be supported

Client Isolation

Disable

When selected, it allows wireless clients connected to the same AP or different APs to communicate with each other in the same VLAN

Hide SSID Do not broadcast SSID in beacons

Mesh Vlan Tagging Enable the vlan tagging over mesh link

Mesh Auto Detect Backhaul Enable the ethernet link status detection and try to connect over mesh link

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mesh base
XV3-8-EC7708(config-wlan-1)# ssid CAMBIUM_MESH_BASE
XV3-8-EC7708(config-wlan-1)# security wpa2-psk
XV3-8-EC7708(config-wlan-1)# passphrase 12345678
XV3-8-EC7708(config-wlan-1)# VLAN 10
XV3-8-EC7708(config-wlan-1)# band 5GHz
```

- WLAN MR profile

cnMaestro configuration:

WLANs > Ent_Mesh_Recovery

Configuration Devices

WLAN

Access Control

Basic Information

Type*
Enterprise Wi-Fi

Name*
Ent_Mesh_Recovery

Description

Basic Settings

SSID

Enable

Transition SSID
Configure the matching open/owe transition SSID

Band
 2.4 GHz 5 GHz 6 GHz Define radio types (2.4 GHz, 5 GHz, 6 GHz) on which this WLAN should be supported

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mesh recovery
XV3-8-EC7708(config-wlan-1)# vlan 10
XV3-8-EC7708(config-wlan-1)# band 5GHz
```

2. To configure MC, following are the commands:

cnMaestro configuration:

WLANs > Ent_Mesh_Client

Configuration Devices

WLAN

Basic Settings

SSID

Enable

SSID*
 The SSID of this WLAN (up to 32 characters)

Mesh
 Mesh Base/Client/Recovery mode

VLAN*
 Default VLAN assigned to clients on this WLAN (1-4094)

Security
 Set authentication and encryption type

Passphrase*
 WPA2 Pre-shared security passphrase or key

Band
 2.4 GHz 5 GHz 6 GHz Define radio types (2.4 GHz, 5 GHz, 6 GHz) on which this WLAN should be supported

Mesh Vlan Tagging Enable the vlan tagging over mesh link

Advanced Settings

Mesh Monitored Host
 IP or hostname that if not reachable a mesh recovery is attempted

Mesh Monitor Duration
 Duration in minutes (5-60)

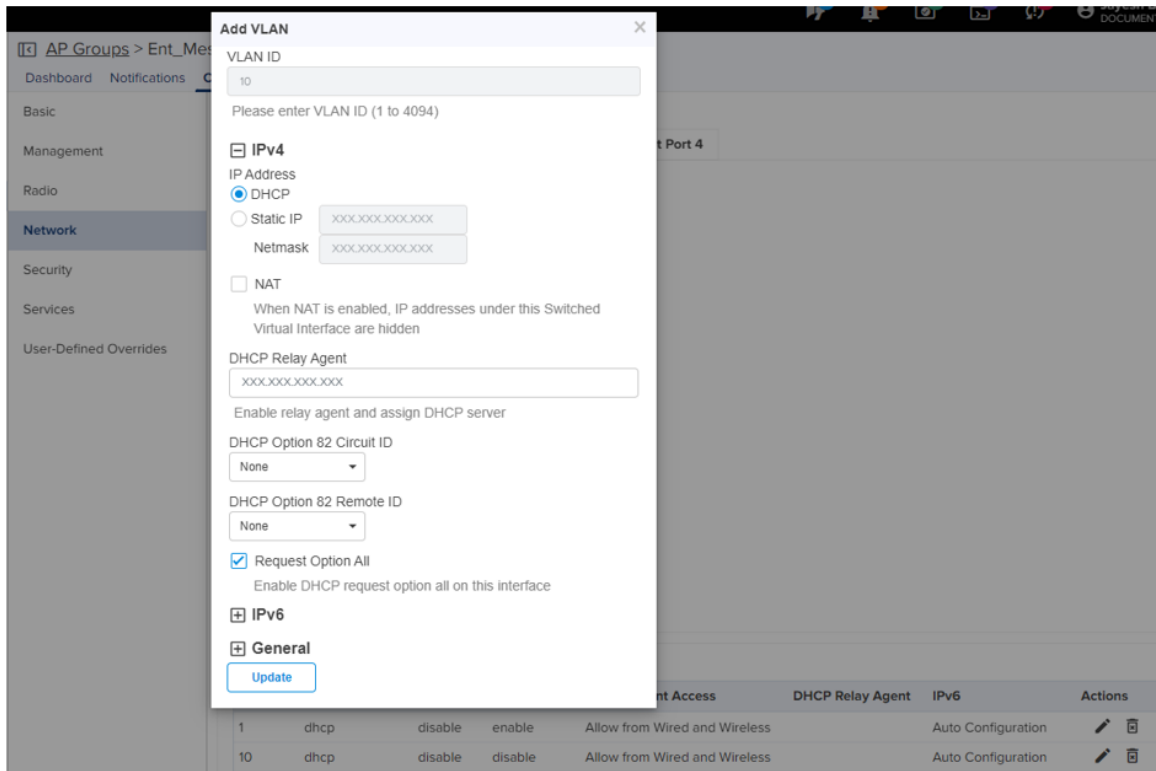

Mesh Recovery Interval
 Interval in minutes after which a full recovery is attempted if the mesh base is not reachable (5-30)

CLI configuration:

```
XV3-8-EC7708(config-wlan-1)# mesh client
XV3-8-EC7708(config-wlan-1)# ssid CAMBIUM_MESH_BASE
XV3-8-EC7708(config-wlan-1)# vlan 10
XV3-8-EC7708(config-wlan-1)# security wpa2-psk
XV3-8-EC7708(config-wlan-1)# passphrase 12345678
XV3-8-EC7708(config-wlan-1)# band 5GHz
XV3-8-EC7708(config-wlan-1)# mesh-recovery-interval
XV3-8-EC7708(config-wlan-1)# mesh-recovery-interval 30
XV3-8-EC7708(config-wlan-1)# mesh-client-monitor
XV3-8-EC7708(config-wlan-1)# mesh-client-monitor duration 5
XV3-8-EC7708(config-wlan-1)# mesh-client-monitor host 8.8.8.8
```

- To configure the Management non-VLAN interface, the following are the commands:

cnMaestro configuration:

CLI configuration:

```
XV3-8-EC7708(config)# interface vlan 10
XV3-8-EC7708(config-vlan-10)# ip address dhcp
XV3-8-EC7708(config-vlan-10)# ip dhcp request-option-all
XV3-8-EC7708(config)# interface eth 1
XV3-8-EC7708(config-eth-1)# switchport mode trunk
XV3-8-EC7708(config-eth-1)# switchport trunk native vlan 1
XV3-8-EC7708(config-eth-1)# switchport trunk allowed vlan 2-4094
```

Typical use-cases

- Wi-Fi access in areas with no cable run
 - Add an AP indoor/outdoor APs for the areas that are difficult to reach
- Small retail location with one AP near an Ethernet outlet, and another in the middle of the lobby that has no easy cable run.
- Resolving coverage issues.
 - Plug coverage holes

- Extend range outdoors
 - An XV2-2T Hotspot in a parking lot outside a building, with XV2-2s providing Wi-Fi within the building

Additional mesh topology supported

Note

The following topology supports zero touch provisioning and single AP group configuration.

Wired devices behind mesh client AP

In this scenario, when wired devices are connected to the mesh client AP (AP2), the AP will support zero touch provisioning and both base and client APs will have the same configuration (AP group). Mesh AP must have the capability to connect a separate LAN segment (containing wired devices) to the WLAN.

When an AP, with factory default configuration, is connected in the above scenario, the device waits for 180 seconds to obtain the IP address from the wired side. If the device does not receive any IP address from the wired side, then mesh recovery is triggered. If the device restarts, the device waits for 360 seconds to obtain the IP address from the wired side. If the device does not receive any IP address from the wired side, then mesh recovery is triggered.

Chapter 15: Guest Access Portal - Internal

Introduction

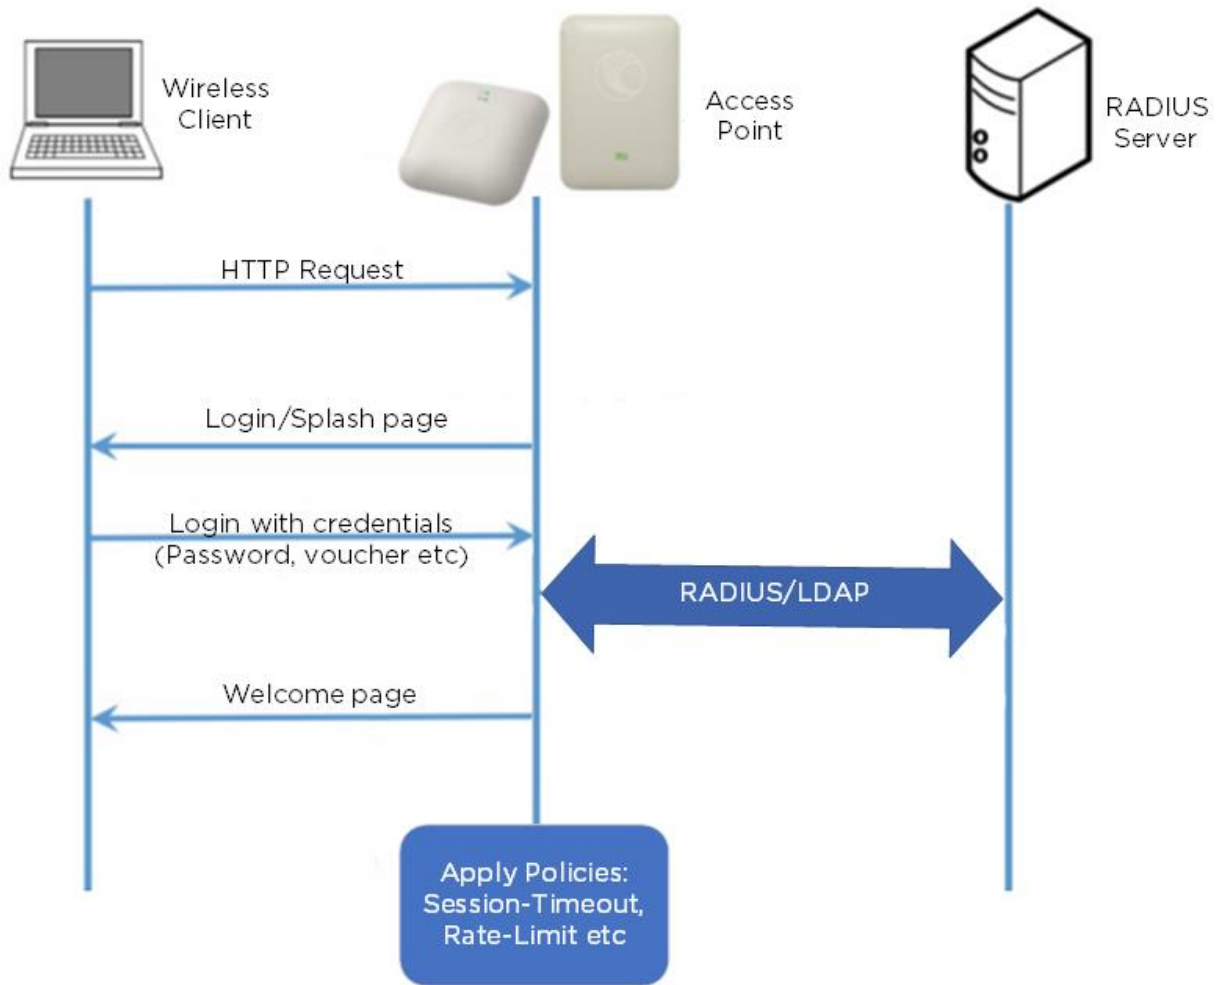

Guest Access Portal services offer a simple way to provide secure access to the internet for users and devices using a standard web browser. Guest access portal allows enterprises to offer authenticated access to the network by capturing and re-directing a web browser's session to a captive portal login page where the user must enter valid credentials to be granted access to the network.

Modes of Captive Portal Services supported by Enterprise Wi-Fi AP devices:

- **Internal Access:** Captive Portal server is hosted on the access point and is local to the AP.
- **External Access:** Enterprise Wi-Fi AP is integrated with multiple third-party Captive Portal services vendors. Based on the vendor, the device needs to be configured. More details on this Guest Access Portal method are described in [Chapter 15](#).
- **cnMaestro:** Captive Portal services are hosted on cnMaestro where various features like Social login, Voucher login, SMS login, and Paid login are supported. More details on this Guest Access Portal method are described in [Chapter 16](#).
- **EasyPass:** EasyPass Access Services enable you to easily provide secure and controlled access to users and visitors on your Wi-Fi network.

This chapter describes about Internal Captive Portal services supported by Enterprise Wi-Fi APs. The following figure displays the basic topology of testing the Internal Captive Portal Service.

Figure 79: Topology

Configurable parameters

The below figure displays multiple configurable parameters supported for Internal Guest Access hosted on AP. **Access Policy - Clickthrough**

Figure 80: Guest Access Internal Access Point parameter

The screenshot shows a configuration page for Guest Access with several tabs: Basic, Radius Server, Guest Access (selected), Usage Limits, Scheduled Access, Access, Passpoint, and Delete. The 'Guest Access' tab is active, displaying various settings:

- Enable:**
- Portal Mode:** Internal Access Point External Hotspot cnMaestro XMS/Easypass
- Access Policy:** Clickthrough *Splash-page where users accept terms & conditions to get on the network*
 Radius *Splash-page with username & password, authenticated with a RADIUS server*
 LDAP *Redirect users to a login page for authentication by a LDAP server*
 Local Guest Account *Redirect users to a login page for authentication by local guest user account*
- Redirect Mode:** HTTP *Use HTTP URLs for redirection*
 HTTPS *Use HTTPS URLs for redirection*
- Redirect Hostname:**
Redirect Hostname for the splash page (up to 255 chars)
- Title:**
Title text in splash page (up to 255 chars)
- Contents:**
Main contents of the splash page (up to 255 chars)
- Terms:**
Terms & conditions displayed in the splash page (up to 255 chars)
- Logo:**
Logo to be displayed on the splash page
- Background Image:**
Background image to be displayed on the splash page
- Success Action:** Internal Logout Page Redirect user to External URL Redirect user to Original URL
- Success message:**
- Redirect:** HTTP-only *Enable redirection for HTTP packets only*
- Redirect User Page:**
Configure IP address for redirecting user to guest portal splash page
- Proxy Redirection Port:**
Port number(1 to 65535)
- Session Timeout:**
Session time in seconds (60 to 2592000)
- Inactivity Timeout:**
Inactivity time in seconds (60 to 2592000)
- MAC Authentication Fallback:** *Use guest-access only as fallback for clients failing MAC-authentication*
- Extend Interface:**
Configure the interface which is extended for guest access

At the bottom, there are 'Save' and 'Cancel' buttons.

Access policy

Click through

When this policy is selected, the user will get a login page to accept **Terms and Conditions** to get access to the network. No additional authentication is required.

Splash page

Title

You can configure the contents of the splash page using this field. Contents should not exceed more than 255 characters.

Contents

You can configure the contents of the splash page using this field. Contents should not exceed more than 255 characters.

Terms and conditions

Terms and conditions to be displayed on the splash page can be configured using this field. Terms and conditions should not exceed more than 255 characters.

Logo

Displays the logo image updated in URL `http(s)://<ipaddress>/<logo.png>`. Either PNG or JPEG format of logo is supported.

Background image

Displays the background image updated in URL `http(s)://<ipaddress>/background/<image.png>`. Either PNG or JPEG format of logo is supported.

Redirect parameters

Redirect hostname

Users can configure a friendly hostname, which is added to the DNS server and is resolvable to Enterprise Wi-Fi AP IP address. This parameter once configured will be replaced with an IP address in the redirection URL provided to wireless stations.

Success action

Provision to configure redirection URL after successful login to captive portal services. Users can configure three modes of redirection URL:

- Internal logout Page

After successful login, the wireless client is redirected to the logout page hosted on AP.

- Redirect users to external URL

Here users will be redirected to the URL which we configured on a device as below:

- Redirect users to the Original URL

Here users will be redirected to a URL that is accessed by the user before successful captive portal authentication.

Figure 81: Success action

Success Action Internal Logout Page Redirect user to External URL Redirect user to Original URL

Redirect

By default, captive portal redirection is triggered when the user accesses either HTTP or HTTPS WWW. If enabled, redirection to Captive Portal Splash Page is triggered when an HTTP WWW is accessed by end-user.

Figure 82: Redirect

Redirect HTTP-only *Enable redirection for HTTP packets only*

Redirect Mode

There are two redirect modes available:

- **HTTP Mode**
When enabled, AP sends an HTTP POSTURL to the client.
- **HTTP(s) Mode**
When enabled, AP sends HTTPS POST URL to the client

Success message

This we can configure so that we can display success message on the splash page after successful authentication

Figure 83: Success Message

Success message

Timeout

Session

This is the duration of time which wireless clients will be allowed internet after guest access authentication.

Figure 84: Session timeout

Session Timeout *Session time in seconds (60 to 2592000)*

Inactivity

This is the duration of time after which wireless clients will be requested for re-login.

Figure 85: *Inactivity timeout*

Inactivity Timeout	<input type="text" value="1800"/>	<i>Inactivity time in seconds (60 to 2592000)</i>
---------------------------	-----------------------------------	---

Whitelist

Provision to configure either Ips or URLs to bypass traffic, therefor users can access those IPs or URLs without Guest Access authentication.

Configuration examples

This section briefs about configuring different methods of Internal Guest Access captive portal services hosted on AP.

Access Policy - Clickthrough

Chapter 16: Guest Access Portal - External

Introduction

Guest access WLAN is designed specifically for BYOD (Bring Your Own Device) setup, where large organizations have both staff and guests running on the same WLAN or similar WLANs. Cambium Networks provides different options to the customers to achieve this based on where the captive portal page is hosted and who will be validating and performing the authentication process.

External Hotspot is a smart Guest Access provision supported by Enterprise Wi-Fi AP devices. This method of Guest Access provides the flexibility of integrating an external 3rd party Web/Cloud hosted captive portal, fully customized. More details on third-party vendors who are integrated and certified with Cambium are listed in the URL https://www.cambiumnetworks.com/wifi_partners/.

Configurable parameters

Figure 88 displays multiple configurable parameters supported for External Guest Access hosted on AP.

Access policy

Clickthrough:

When this policy is selected, the user will get a login page to accept **Terms and Conditions** to get access to the network. No additional authentication is required.

WISPr

WISPr clients external server login

Provision to enable re-direction of guest access portal URL obtained through WISPr.

External portal post through cnMaestro

This is required when HTTPS is only supported by an external guest access portal. This option when enabled minimizes certification. The certificate is required to install only in cnMaestro.

External portal type

Only standard mode configuration is supported by Enterprise Wi-Fi AP products.

Standard

This mode is selected, for all third-party vendors whose Guest Access services is certified and integrated with Enterprise Wi-Fi AP products.

Redirect parameters

Success action

Provision to configure redirection URL after successful login to captive portal services. Users can configure three modes of redirection URL:

- Internal logout Page

After successful login, the wireless client is redirected to the logout page hosted on AP.

- Redirect users to external URL

Here users will be redirected to the URL which we configured on the device as below:

- Redirect users to the original URL

Here users will be redirected to a URL that is accessed by the user before successful captive portal authentication.

Figure 89: Success action

Redirect

By default, captive portal redirection is triggered when the user accesses either HTTP or HTTPS WWW. If enabled, redirection to Captive Portal Splash Page is triggered when an HTTP WWW is accessed by end-

user.

Figure 90: Redirect

Redirect HTTP-only *Enable redirection for HTTP packets only*

Redirect mode

There are two redirect modes available:

- HTTP Mode
When enabled, AP sends an HTTP POSTURL to the client.
- HTTP(s) Mode
When enabled, AP sends HTTPS POST URL to the client

Success message

This we can configure so that we can display success message on the splash page after successful authentication

Figure 94: Authentication – redirected splash page

Figure 95: Successful Login – redirected splash page

Chapter 17: Guest Access – cnMaestro

Cambium supports end-to-end Guest Access Portal services with a combination of Enterprise Wi-Fi AP and cnMaestro. cnMaestro supports various types of authentication mechanisms for wireless clients to obtain Internet access. For further information about Guest Access Portal:

- For On-Premises, go to <https://support.cambiumnetworks.com/files/cnmaestro/> and download the latest *cnMaestro On-Premises User Guide*.
- For cnMaestro Cloud, go to [cnMaestro Cloud User Guide](#).

Chapter 18: Auto VLAN

The Auto VLAN is intended to support zero-touch detection and configuration for connected Enterprise Wi-Fi APs. New Cambium vendor-specific LLDP TLVs are introduced starting with cnMatrix Release 3.1 to support “pushing” PBA policy data from Enterprise Wi-Fi APs to cnMatrix. The new PBA TLVs are implemented as an extension to the LLDP standard, using its flexible extension mechanism.

From a functional perspective, cnMatrix, acting as the upstream device, includes the PBA authentication TLV in the regularly generated LLDPDUs for a port. The downstream device receives the PBA authentication TLV, and, if policy action data (for example VLANs) is present to be pushed to cnMatrix, a PBA device settings TLV is constructed and added to the LLDPDU for the port.

The below table lists the fields that are required for configuring Auto-VLAN:

Table 61: Configuring Auto-VLAN parameters

Parameters	Description	Range	Default
lldp pba	New PBA TLVs is shared with cnMatrix switch.	–	Enabled
lldp pba-auth-key	The shared private key used during PBA TLV authentication can be updated or reset from its default value (by using the ‘no’ option).	–	Enabled with default key

Note

lldp pba-auth-key default value cannot be shared due to security concerns.

CLI configuration:

Syntax:

```
XV3-8-EC7708(config)# lldp
XV3-8-EC7708(config)# lldp pba-auth-key
```

Example:

```
XV3-8-EC7708(config)# lldp pba
XV3-8-EC7708(config)# lldp pba-auth-key 123456789
```

Chapter 19: Device Recovery Methods

Factory reset via 'RESET' button

XV2-21X	Press and hold the Reset button for 15 seconds	Both LEDs will be OFF and turned onto Amber
XV2-23T	Press and hold the Reset button for 15 seconds	Both LEDs will be OFF and turned onto Amber
XV2-22H	Press and hold the Reset button for 15 seconds	Both LEDs will be OFF and turned onto Amber

Boot partition change via power cycle

Table 63: Boot partition change via power cycle

Access Point	Procedure
XV3-8	Follow power ON and off 9 times with an interval of 120 Sec (ON) and 5 Sec (OFF)
XE5-8	Follow power ON and off 9 times with an interval of 120 Sec (ON) and 5 Sec (OFF)
XV2-2	Follow power ON and off 9 times with an interval of 120 Sec (ON) and 5 Sec (OFF)
XV2-2T0	Follow power ON and off 9 times with an interval of 120 Sec (ON) and 5 Sec (OFF)
XV2-2T1	Follow power ON and off 9 times with an interval of 120 Sec (ON) and 5 Sec (OFF)

Access Point	Procedure
XE3-4	Follow power ON and off 9 times with an interval of 120 Sec (ON) and 5 Sec (OFF)
XE3-4TN	Follow power ON and off 9 times with an interval of 120 Sec (ON) and 5 Sec (OFF)
XV2-21X	Follow power ON and off 9 times with an interval of 120 Sec (ON) and 5 Sec (OFF)
XV2-23T	Follow power ON and off 9 times with an interval of 120 Sec (ON) and 5 Sec (OFF)
XV2-22H	Follow power ON and off 9 times with an interval of 120 Sec (ON) and 5 Sec (OFF)

Disable factory Reset Button

User can disable the physical Reset Button on the device by using the below CLI command:

```
XV3-8-EC7708(config)# no system hw-reset
```

Warning

Please keep in mind that the **Reset Button** is a key recovery option in situations when an AP gets misconfigured and you are not able to connect to the AP so by disabling the Reset Button, you lose the ability to recover the AP in such a scenario.

Chapter 20: Command-Line Interface (CLI)

The Enterprise Wi-Fi products support Command-Line Interface (CLI) which helps in configuring as well as monitoring the devices.

Show commands

The below table provides **Show commands** supported in Enterprise Wi-Fi AP:

Table 64: Show commands supported in Enterprise Wi-Fi AP

SL No	CLI Command	Description
Deep Packet Inspection (DPI)		
1	<code>show application-statistics by-application</code>	Displays statistics of each application that is accessed by the station connected to the AP.
2	<code>show application-statistics by-category</code>	Displays statistics of application category that is accessed by the station connected to the AP.
Network Information		
3	<code>show arp</code>	Displays list of ARP entries learned by AP.
4	<code>show conntrack</code>	Displays current connection track entries along with application ID Mapping.
5	<code>show route</code>	Displays IP route information.
6	<code>show dhcp-pool <Index number></code>	Displays the DHCP pool configuration.
7	<code>show interface brief</code>	Displays interface details such as IP, Netmask, and traffic statistics.
8	<code>show ip dhcp-client-info</code>	Displays the DHCP options learned by device across all interfaces.
9	<code>show ip domain-name</code>	Displays learned domain name information.
10	<code>show ip gw-source-precedence</code>	Displays the Precedence of gateway sources.
11	<code>show ip interface</code>	Displays IP interface parameters.
12	<code>show ip name-server</code>	Displays DNS server information.
13	<code>show ip neighbour</code>	Displays IPv4 neighbour entries.
14	<code>show ip route</code>	Displays IP route information.
15	<code>show ipv6 dhcp-client-info</code>	Displays learned DHCPv6 client information.
16	<code>show ipv6 domain-name</code>	Displays learned domain name information.

SL No	CLI Command	Description
17	show ipv6 gw-source-precedence	Displays the precedence of gateway sources.
18	show ipv6 interface brief	Displays IPv6 interface parameters.
19	show ipv6 name-server	Displays DNS server information.
20	show ipv6 neighbour	Displays neighbour entries.
21	show ipv6 route	Displays IP route information.
Radio Information		
22	show auto-rf channel-info	Displays Auto-RF channel information.
23	show auto-rf history	Displays Auto-RF history.
24	show wireless band-steer client-cache	Displays band steered client cache.
25	show wireless mesh ipv6	Displays IPv6 address of associated mesh clients .
26	show wireless mesh-xtnded-list	Displays mesh extended device list for 2.4 GHz when mesh-xtnded-dev-list is enabled.
27	show wireless neighbors 2.4GHz	Displays 2.4 GHz wireless neighbors.
28	show wireless neighbors 5GHz	Displays 5G Hz wireless neighbors.
29	show wireless neighbors 6GHz	Displays 6 GHz wireless neighbors.
30	show wireless neighbors autocell	Displays Auto-cell neighbors.
31	show wireless radios channels	Displays supported channels.
32	show wireless radios mu-mimo-statistics	Displays MU-MIMO statistics of Radios.
33	show wireless radios multicast-to-unicast	Displays multicast-to-unicast configuration.
34	show wireless radios ofdma-statistics	Displays OFDMA statistics of Radios.
35	show wireless radios rf-statistics	Displays statistics of Radios.
36	show wireless radios statistics	Displays statistics of Radios.
37	show wireless wlans aggregate-statistics	Displays aggregate statistics of wireless LANs.
38	show wireless wlans interface	Displays wireless WLAN interface details.

SL No	CLI Command	Description
39	show wireless wlans monitor-host	Displays monitor host information for wireless LANs.
40	show wireless wlans statistics	Displays statistics of wireless LANs.
Bonjour Information		
41	show bonjour-services	Displays Bonjour services available.
42	show bonjour-statistics	Displays Bonjour rule statistics.
System Information		
43	show upgrade-status	Displays last upgrade status.
44	show version	Displays device firmware information.
45	show timezones	Displays list of timezone locations.
46	show management details	Displays management status in detail.
47	show mfgrom	Displays manufacturing ROM details.
48	show country-codes	Displays a list of supported countries and corresponding country codes.
49	show boot	Displays device firmware active-backup versions.
50	show cambium-id	Displays configured Cambium-ID (if any).
51	show clock	Displays system time.
52	show config all	Displays current configuration including defaults.
53	show config dhcp-pools all	Displays DHCP pools configuration including defaults.
54	show config filter	Displays Filter configuration.
55	show config wireless all	Displays wireless configuration including defaults.
56	show config system all	Displays infra configuration including defaults.
57	show config system interfaces	Displays network interface configuration.
58	show events	Displays recent event messages.
Guest Access		
59	show ext-guest clients	Displays information of ext-guest clients.
Filters		
60	show filter-statistics	Displays filter statistics.
LLDP		
61	show lldp chassis	Displays local chassis data.

SL No	CLI Command	Description
62	show lldp configuration	Displays configuration.
63	show lldp interfaces	Displays interfaces data.
64	show lldp neighbors	Displays neighbors data.
65	show lldp statistics	Displays statistics.
66	show power	Displays power conditions.
67	show packet-capture status	Displays status of packet capture.
Real-Time Location System		
68	show rtls aeroscout ble-tag-summary	Displays AeroScout BLE-tag summary.
69	show rtls aeroscout configuration	Displays AeroScout Wi-Fi-tag configuration.
70	show rtls aeroscout wifi-tag-summary	Displays AeroScout Wi-Fi-tag summary.
Tunnel		
71	show tunnel-statistics	Displays tunnel statistics.
72	show tunnel-status details	Displays tunnel parameters.
73	show ip pppoe-client-info	Displays learned PPPoE client information.
74	show pppoe-status	Displays PPPoE status.

Service commands

Service show

The below table provides **Service show commands** supported in Enterprise Wi-Fi AP:

Table 65: Service show commands supported in Enterprise Wi-Fi AP

SL No	CLI Command	Description
1	service show bridge	Displays AP bridge table entries.
2	service show client-cache	Displays current client status and history of clients connected and respective parameters.
3	service show config	Displays configuration from data base.
4	service show cores	Displays process cores (if any).
5	service show debug-logs <Process Names>	Displays debug logs of various processes.
6	service show df	Displays flash status.

SL No	CLI Command	Description
7	<code>service show dmesg</code>	Displays system kernel logs.
8	<code>service show epsk</code>	Displays ePSK information.
9	<code>service show ethtool</code>	Displays information and statistics w.r.t Ethernet interfaces.
10	<code>service show guest-portal whitelist wlan <wlan index></code>	Displays whitelist entries either configured or auto-selected by a device in a guest portal WLAN profile.
11	<code>service show ifconfig</code>	Displays status and statistics of all interfaces configured and supported on the device.
12	<code>service show iperfd-logs</code>	Display IPERF logs when iperfd daemon is enabled on device.
13	<code>service show iwconfig</code>	Displays status and statistics of all Wireless interfaces configured on the device.
14	<code>service show last-reboot- reason</code>	Displays the reason for the last reboot of the AP.
15	<code>service show last-reboot- state watchdog</code>	Displays if the last reboot reason is due to watchdog.
16	<code>service show mcastsnoop</code>	Displays multicast-snoop tables.
17	<code>service show mdnsd- statistics</code>	Displays mDNS packet stats on mdnsd.
18	<code>service show memory</code>	Displays memory information.
19	<code>service show netstat</code>	Displays network socket connections.
20	<code>service show ps</code>	Displays a list of processes.
21	<code>service show ps-restart- history</code>	Displays history of process restart on the AP.
22	<code>service show route</code>	Displays routing table.
23	<code>service show top</code>	Displays process activity status.

Service system

The below table provides **Service system** commands supported in Enterprise Wi-Fi AP:

Table 66: Service system commands supported in Enterprise Wi-Fi AP

SL No	CLI Command	Description
1	<code>service boot backup- firmware</code>	Helps to boot to other partition.
2	<code>service clear-cores</code>	Clear system core files (if any).
3	<code>service clear-dhcp-pool</code>	Clear DHCP pool allocated addresses.

SL No	CLI Command	Description
4	<code>service debug <process name>logging-level <logging-level></code>	Commands to enable debugging of processes at various logging levels.
5	<code>service flash-leds</code>	Flash system LEDs help identify this device visually.
6	<code>service radio apstats</code>	Displays aggregate statistics of all wireless interfaces.
7	<code>service radio athstats</code>	Displays aggregate Radio traffic statistics.
8	<code>service radio iwpriv</code>	Displays supported iwpriv commands.
9	<code>service radio thermaltool</code>	Displays radio current operating temperature.
10	<code>service schedule reload</code>	Reboot AP at the specified time.
11	<code>service ssh host add</code>	Add a host and key to the known hosts list.
12	<code>service ssh host del</code>	Delete a host and key from the known hosts list.
13	<code>service system-trace</code>	Start a trace session for troubleshooting.
14	<code>service test leds</code>	Displays test LEDs.
15	<code>service test radio</code>	Displays status and configured Radio.

Chapter 21: cnMaestro X Assurance

**Note:**

This feature is available from cnMaestro 4.1.0 and later versions only.

The cnMaestro X Assurance feature provides enhanced visibility into the health of Wi-Fi client connections, including root cause analysis of failures with possible recommended actions. It also provides analytics on aggregated data that can help to improve clients connectivity in the Wi-Fi network.

**Note:**

This feature is currently available as a free trial to all cnMaestro X customers. In future, this feature will require a separate paid subscription.

The cnMaestro X Assurance feature analyzes the Wi-Fi client connection events and helps to troubleshoot common network connectivity and performance issues such as the following:

- Connectivity—Association, authentication, and network connectivity services, such as DHCP and DNS transaction failures.
- Poor Performance—Low RSSI, low data rate, AAA, DHCP, DNS transaction latency.

For more information, refer to the *cnMaestro User Guide*.

Glossary

Term	Definition
AP	Access Point Module. One module that distributes network or Internet services to subscriber modules.
API	Application Program Interface
ARP	Address Resolution Protocol. A protocol defined in RFC 826 to allow a network element to correlate a host IP address to the Ethernet address of the host.
BT	Bluetooth
DFS	See Dynamic Frequency Selection
DHCP	Dynamic Host Configuration Protocol defined in RFC 2131. The protocol that enables a device to be assigned a new IP address and TCP/IP parameters, including a default gateway, whenever the device reboots. Thus, DHCP reduces configuration time, conserves IP addresses, and allows modules to be moved to a different network within the system.
Ethernet Protocol	Any of several IEEE standards that define the contents of frames that are transferred from one network element to another through Ethernet connections.
FCC	Federal Communications Commission of the U.S.A.
GPS	Global Positioning System. A network of satellites that provides absolute time to networks on earth, which use the time signal to synchronize transmission and reception cycles (to avoid interference) and to provide reference for troubleshooting activities.
UI	User interface.
HTTP	Hypertext Transfer Protocol, used to make the Internet resources available on the World Wide Web.
HTTPS	Hypertext Transfer Protocol Secure
HT	High Throughput
IP Address	The 32-bit binary number identifies a network element by both network and host. See also Subnet Mask.
IPv4	The traditional version of Internet Protocol, defines 32-bit fields for data transmission.
LLDP	Link Layer Discovery Protocol
MAC Address	Media Access Control address. The hardware address that the factory assigns to the module for identification in the Data Link layer interface of the Open Systems Interconnection system. This address serves as an electronic serial number.
MIB	Management Information Base. Space that allows a program (agent) in the network to relay information to a network monitor about the status of defined variables (objects).
MIR	See Maximum Information Rate.
PPPoE	Point to Point Protocol over Ethernet. Supported on SMs for operators who use PPPoE in other parts of their network operators who want to deploy PPPoE to realize per-subscriber authentication, metrics, and usage control.

Term	Definition
Proxy Server	Network computer that isolates another from the Internet. The proxy server communicates for the other computer, and sends replies to only the appropriate computer which has an IP address that is not unique or not registered.
PoE	Power over Ethernet.
SLA	Service Level Agreement
VLAN	Virtual local area network. An association of devices through software that contains broadcast traffic, as routers would, but in the switch-level protocol.
VPN	A virtual private network for communication over a public network. One typical use is to connect remote employees, who are at home or in a different city, to their corporate network over the Internet. Any of several VPN implementation schemes are possible. SMs support L2TP over IPSec (Level 2 Tunneling Protocol over IP Security) VPNs and PPTP (Point to Point Tunneling Protocol) VPNs, regardless of whether the Network Address Translation (NAT) feature enabled.

Appendix

This appendix contains the following topics:

- Supported RADIUS Attributes
- Supported DFS channels

Supported RADIUS Attributes

This topic lists the following RADIUS override attributes that are supported on Enterprise Wi-Fi APs:

- [WISPr VSAs \(Vendor ID: 14122\)](#)
- [Cambium VSAs \(Vendor ID: 17713\)](#)
- [Standard RADIUS attributes](#)
- [RADIUS attributes in authentication and accounting packets with WPA2-Enterprise security](#)
- [Supported CoA messages](#)

WISPr VSAs (Vendor ID: 14122)

Table 67 lists the WISPr vendor-specific attributes (VSAs) supported on Enterprise Wi-Fi APs.

Table 67: WISPr VSAs

Attribute Value	Attribute Description	Attribute Type	RADIUS Message Types			Accounting Messages			WPA2 / WPA3 - Enterprise Authentication Support	Guest Access Support
			Request	Response / Challenge	Accept	Start	Interim	Stop		
2	WISPr-Location-Name	string	Yes	-NA-	No	Yes	Yes	Yes	Yes	Yes
7	WISPr-Bandwidth-Max-Up	integer	No	No	Yes	No	No	No	Yes	Yes
8	WISPr-Bandwidth-Max-Down	integer	No	No	Yes	No	No	No	Yes	Yes
9	WISPr-Session-Terminate-Time	string	No	No	Yes	No	No	No	Yes	Yes

Table 68 lists the WISPr VSAs supported on Enterprise Wi-Fi APs with CoA support.

Table 68: WISPr VSAs with CoA

Attribute Value	Attribute Description	Attribute Type	RADIUS Message Types			Accounting Messages			CoA Support with Guest Access	CoA Support with WPA2 / WPA3 - Enterprise Authentication
			Request	Response / Challenge	Accept	Start	Interim	Stop		
2	WISPr-Location-Name	string	Yes	-NA-	No	Yes	Yes	Yes	-NA-	-NA-
7	WISPr-Bandwidth-Max-Up	integer	No	No	Yes	No	No	No	Yes	Yes
8	WISPr-Bandwidth-Max-Down	integer	No	No	Yes	No	No	No	Yes	Yes
9	WISPr-Session-Terminate-Time	string	No	No	Yes	No	No	No	Yes	Yes

Cambium VSAs (Vendor ID: 17713)

Table 69 lists the Cambium Networks VSAs supported on Enterprise Wi-Fi APs.

Table 69: Cambium VSAs

Attribute Value	Attribute Description	Attribute Type	RADIUS Message Types			Accounting Messages			WPA2 / WPA3 - Enterprise Authentication Support	Guest Access Support
			Request	Response / Challenge	Accept	Start	Interim	Stop		
151	Cambium-Wi-Fi-Quota-Up	integer	No	No	Yes	No	No	No	-NA-	Yes
152	Cambium-Wi-Fi-Quota-Down	integer	No	No	Yes	No	No	No	-NA-	Yes
155	Cambium-Wi-Fi-Quota-Total	integer	No	No	Yes	No	No	No	-NA-	Yes
153	Cambium-Wi-Fi-Quota-Up-Gigaword	integer64	No	No	Yes	No	No	No	-NA-	Yes
154	Cambium-Wi-Fi-Quota-Down-Gigaword	integer64	No	No	Yes	No	No	No	-NA-	Yes

Attribute Value	Attribute Description	Attribute Type	RADIUS Message Types			Accounting Messages			WPA2 / WPA3 - Enterprise Authentication Support	Guest Access Support
			Request	Response / Challenge	Accept	Start	Interim	Stop		
156	Cambium-Wi-Fi-Quota-Total-Gigaword	integer64	No	No	Yes	No	No	No	-NA-	Yes
157	Cambium-VLAN-Pool-ID	string	No	No	Yes	No	No	No	Yes	No
159	Cambium-Traffic-Classes-Acct	TLV								
159.2	Cambium-Acct-Input-Octets	integer	No	No	No	No	Yes	Yes		
159.3	Cambium-Acct-Output-Octets	integer	No	No	No	No	Yes	Yes		
159.4	Cambium-Acct-Input-Packets	integer	No	No	No	No	Yes	Yes		
159.5	Cambium-Acct-Output-Packets	integer	No	No	No	No	Yes	Yes		
161	Cambium-ePSK	TLV							-NA-	Yes
161.1	Cambium-ePSK-Anonce	string	Yes	-NA-	No				-NA-	Yes
161.2	Cambium-ePSK-M2	string	Yes	-NA-	No				-NA-	Yes
161.3	Cambium-ePSK-BSSID	string	Yes	-NA-	No				-NA-	Yes
161.4	Cambium-ePSK-AP-MAC	string	Yes	-NA-	No				-NA-	Yes
161.5	Cambium-ePSK-SSID	string	Yes	-NA-	No				-NA-	Yes
161.6	Cambium-ePSK-PMK	string	No	-NA-	Yes				-NA-	Yes

Table 70 lists the Cambium Networks VSAs supported on Enterprise Wi-Fi APs with CoA.

Table 70: Cambium VSAs with CoA

Attribute Value	Attribute Description	Attribute Type	RADIUS Message Types			Accounting Messages			CoA Support with Guest Access	CoA Support with WPA2 / WPA3 - Enterprise Authentication
			Request	Response / Challenge	Accept	Start	Interim	Stop		
151	Cambium-Wi-Fi-Quota-Up	integer	No	No	Yes	No	No	No	Yes	
152	Cambium-Wi-Fi-Quota-Down	integer	No	No	Yes	No	No	No	Yes	
155	Cambium-Wi-Fi-Quota-Total	integer	No	No	Yes	No	No	No	Yes	
153	Cambium-Wi-Fi-Quota-Up-Gigaword	integer64	No	No	Yes	No	No	No	Yes	
154	Cambium-Wi-Fi-Quota-Down-Gigaword	integer64	No	No	Yes	No	No	No	Yes	
156	Cambium-Wi-Fi-Quota-Total-Gigaword	integer64	No	No	Yes	No	No	No	Yes	
157	Cambium-VLAN-Pool-ID	string	No	No	Yes	No	No	No		
159	Cambium-Traffic-Classes-Acct	TLV								
159.2	Cambium-Acct-Input-Octets	integer	No	No	No	No	Yes	Yes		
159.3	Cambium-Acct-Output-Octets	integer	No	No	No	No	Yes	Yes		
159.4	Cambium-Acct-Input-Packets	integer	No	No	No	No	Yes	Yes		
159.5	Cambium-Acct-Output-Packets	integer	No	No	No	No	Yes	Yes		
161	Cambium-ePSK	TLV							-NA-	-NA-
161.1	Cambium-ePSK-Anonce	string	Yes	-NA-	No				-NA-	-NA-

Attribute Value	Attribute Description	Attribute Type	RADIUS Message Types			Accounting Messages			CoA Support with Guest Access	CoA Support with WPA2 / WPA3 - Enterprise Authentication
			Request	Response / Challenge	Accept	Start	Interim	Stop		
161.2	Cambium-ePSK-M2	string	Yes	-NA-	No				-NA-	-NA-
161.3	Cambium-ePSK-BSSID	string	Yes	-NA-	No				-NA-	-NA-
161.4	Cambium-ePSK-AP-MAC	string	Yes	-NA-	No				-NA-	-NA-
161.5	Cambium-ePSK-SSID	string	Yes	-NA-	No				-NA-	-NA-
161.6	Cambium-ePSK-PMK	string	No	-NA-	Yes				-NA-	-NA-

Standard RADIUS attributes

Table 71 lists the standard RADIUS attributes supported on Enterprise Wi-Fi APs.

Table 71: Standard RADIUS attributes

Attribute Value	Attribute Description	Attribute Type	RADIUS Message Types			Accounting Messages			WPA2 / WPA3 - Enterprise Authentication Support	Guest Access Support
			Request	Response / Challenge	Accept	Start	Interim	Stop		
11	Filter-Id (text) - Group-ID	text	No	-NA-	Yes	No	No	No	Yes	
24	State	string	Yes	Yes	No				Yes	-NA-
25	Class	string	No	-NA-	Yes	Yes	No	No	Yes	Yes
27	Session-Timeout	integer	No	-NA-	Yes	No	No	No	Yes	Yes
28	Idle-Timeout	integer	No	-NA-	Yes	No	No	No		Yes
64	Tunnel-Type	enum	No	-NA-	Yes	No	No	No	Yes	Yes
65	Tunnel-Medium-Type	enum	No	-NA-	Yes	No	No	No	Yes	Yes
81	Tunnel-Private-Group-Id	text	No	-NA-	Yes	No	No	No	Yes	Yes

Attribute Value	Attribute Description	Attribute Type	RADIUS Message Types			Accounting Messages			WPA2 / WPA3 - Enterprise Authentication Support	Guest Access Support
			Request	Response / Challenge	Accept	Start	Interim	Stop		
85	Acct-Interim-Interval	integer	No	-NA-	Yes	No	No	No	Yes	Yes
	Disconnect		RADIUS packet							
40	Disconnect-Request	-	RADIUS packet	-NA-	-NA-	-NA-	-NA-	-NA-	-NA-	-NA-
41	Disconnect-ACK	-	RADIUS packet	-NA-	-NA-	-NA-	-NA-	-NA-		
42	Disconnect-NAK	-	RADIUS packet	-NA-	-NA-	-NA-	-NA-	-NA-		
43	CoA-Request	-	RADIUS packet	-NA-	-NA-	-NA-	-NA-	-NA-		
44	CoA-ACK	-	RADIUS packet	-NA-	-NA-	-NA-	-NA-	-NA-		
45	CoA-NAK	-	RADIUS packet	-NA-	-NA-	-NA-	-NA-	-NA-		

Table 72 lists the standard RADIUS attributes supported on Enterprise Wi-Fi APs with CoA support.

Table 72: Standard RADIUS attributes with CoA

Attribute Value	Attribute Description	Attribute Type	RADIUS Message Types			Accounting Messages			CoA Support with Guest Access	CoA Support with WPA2 / WPA3 - Enterprise Authentication
			Request	Response / Challenge	Accept	Start	Interim	Stop		
11	Filter-Id (text) - Group-ID	text	No	-NA-	Yes	No	No	No	Yes	Yes
24	State	string	Yes	Yes	No					Yes

Attribute Value	Attribute Description	Attribute Type	RADIUS Message Types			Accounting Messages			CoA Support with Guest Access	CoA Support with WPA2 / WPA3 - Enterprise Authentication
			Request	Response / Challenge	Accept	Start	Interim	Stop		
25	Class	string	No	-NA-	Yes	Yes	No	No	-NA-	-NA-
27	Session-Timeout	integer	No	-NA-	Yes	No	No	No	-NA-	-NA-
28	Idle-Timeout	integer	No	-NA-	Yes	No	No	No	-NA-	-NA-
64	Tunnel-Type	enum	No	-NA-	Yes	No	No	No	-NA-	-NA-
65	Tunnel-Medium-Type	enum	No	-NA-	Yes	No	No	No	-NA-	-NA-
81	Tunnel-Private-Group-Id	text	No	-NA-	Yes	No	No	No	No	Yes

79	EAP-Message	concat	Yes	Yes	Yes	No	No	No
80	Message-Authenticator	string	Yes	Yes	Yes	No	No	No
85	Acct-Interim-Interval	integer	No	No	Yes	No	No	No
87	NAS-Port-Id	text	Yes	No	No	Yes	Yes	Yes

Supported CoA messages

Table 74 lists the supported CoA messages.

Table 74: CoA messages

CoA Message	Supported by MAB (Wired Clients)	Supported by the AP
Disconnect client	Yes	Yes
Update VLAN	Yes	Yes
Session Timeout	No	Yes
Accounting Interval	Yes	Yes
Quota Limit	No	Yes

Note

Following are the mandatory parameters to be included in the CoA message:

- When sent through cnMaestro—User-Name, Calling-Station-Id, and Session ID
- When sent directly through the AP—User-Name, Calling-Station-Id, and NAS-Identifier

Supported DFS channels

Table 75 lists the DFS channel support for various platforms in conformance with FCC standards.

Table 75: DFS channel support for FCC

AP Model	5250-5350 MHz (U-NII-2A)	5470-5725 MHz (U-NII-2C)	5725-5850 MHz (U-NII-3)
XE3-4TN	Yes	Yes	Yes
XV2-22H	Yes	Yes	Yes
XV2-21X	Yes	Yes	Yes
XV2-23T	Yes	Yes	Yes
XE3-4	Yes	Yes	Yes
XE5-8	Yes	Yes	Yes
XV2-2	Yes	Yes	Yes
XV3-8	Yes	Yes	Yes
XV2-2T0	Yes	Yes	Yes
XV2-2T1	Yes	Yes	Yes

Table 76 lists the DFS channel support for various platforms in conformance with IC standards.

Table 76: DFS channel support for IC

AP Model	5250-5350 MHz (U-NII-2A)	5470-5725 MHz (U-NII-2C)	5725-5850 MHz (U-NII-3)
XE3-4TN	Yes	Yes	Yes
XV2-22H	Yes	Yes	Yes
XV2-21X	Yes	Yes	Yes
XV2-23T	Yes	Yes	Yes
XE3-4	Yes	Yes	Yes
XE5-8	Yes	Yes	Yes
XV2-2	Yes	Yes	Yes
XV3-8	Yes	Yes	Yes
XV2-2T0	Yes	Yes	Yes
XV2-2T1	Yes	Yes	Yes

Table 77 lists the DFS channel support for various platforms in conformance with CE standards.

Table 77: DFS channel support for CE

AP Model	5250-5350 MHz (U-NII-2A)	5470-5725 MHz (U-NII-2C)	5725-5850 MHz (U-NII-3)
XE3-4TN	Yes	Yes	Yes
XV2-22H	Yes	Yes	Yes

AP Model	5250-5350 MHz (U-NII-2A)	5470-5725 MHz (U-NII-2C)	5725-5850 MHz (U-NII-3)
XV2-21X	Yes	Yes	Yes
XV2-23T	Yes	Yes	Yes
XE3-4	Yes	Yes	Yes
XE5-8	Yes	Yes	Yes
XV2-2	Yes	Yes	No
XV3-8	No	Yes	No
XV2-2T0	Yes	Yes	Yes
XV2-2T1	Yes	Yes	Yes

Supported 6 GHz countries

Table 78 lists the countries where 6 GHz band is available and the frequencies supported.

Note

Availability of these channels is subjected to respective country regulations.

6 GHz frequency is supported only on the following Enterprise Wi-Fi APs: XE3-4, XE3-4TN, and XE5-8.

Table 78: List of countries where 6 GHz band is supported

Country	XE3-4		XE5-8			
	Frequencies Supported	Channels Supported	Frequencies Supported	Channels Supported (No Channel Distribution)	Channels Supported (With Channel Distribution Enabled)	
					Radio 2	Radio 3
Australia (AU)	5945-6425 MHz	1-93	5945-6425 MHz	1-93	1-61	65-93
Brazil (BR)	5945-7125 MHz	1-233	5945-7125 MHz	1-233	1-93	129-233
Canada (CA)	5945-7125 MHz	1-233	5945-7125 MHz	1-233	1-93	97-233
Colombia (CO)	5945-7125 MHz	1-233	5945-7125 MHz	1-233	1-93	129-233
France (FR)	5945-6425 MHz	1-93	5945-6425 MHz	1-93	1-61	65-93
Germany (DE)	5945-6425 MHz	1-93	5945-6425 MHz	1-93	1-61	65-93
Ireland (IE)	5945-6425 MHz	1-93	5945-6425 MHz	1-93	1-61	65-93

Country	XE3-4		XE5-8

Cambium Networks

Cambium Networks delivers wireless communications that work for businesses, communities, and cities worldwide. Millions of our radios are deployed to connect people, places, and things with a unified wireless fabric that spans multiple standards and frequencies of fixed wireless and Wi-Fi, all managed centrally via the cloud. Our multi-gigabit wireless fabric offers a compelling value proposition over traditional fiber and alternative wireless solutions. We work with our Cambium certified Connected Partners to deliver purpose built networks for service provider, enterprise, industrial, and government connectivity solutions in urban, suburban, and rural environments, with wireless that just works.
